> about what I should be getting between 50 and 54 Mhz ...

Don't expect the same type of operation as on 2 meters or higher.

I have noticed that most 6 meter stalwarts either sit on
52.525 waiting for a band opening or talking about how terrible
traffic and the general state of American society is becoming, or
the local repeater run by one or two guys serves as a wide area
intercom system. Most systems are PL to prevent band openings from
bringing up the repeater.

Fun stuff, 6 meters. I remember the day I got sick of working everyone
in California from Washington D.C. after 5 hours and just
turned the radio off. :)

Nah, The TS-440s has more features and is a much better radio than the

IC-735...

Actually the TS-440s, IC-735, and FT757 are all in the same class in both performance and price.

I prefer the TS-440s because of the internal antenna tuner, 100 watts output 100% duty cycle, and the 100 memories. I feel that these are the advantages of this radio.

On paper the specs of the ICOM radios look better but when the radios are tested they are the same. I am convinced that ICOM uses a more optomistic measurement method. I know this to be a fact when Hams tested the TS-950SD to the IC-781 and IC-765. The Kenwood radio came right in on spec and the ICOM radio was closer to the Kenwood spec than to the ICOM spec.

One of the problems I ran into when measuring antenna impedance was that strong signals (especially the 50 KW BCB station 10 miles away) tended to overload the impedance meter or noise bridge. With the noise bridge you have the additional problem of hearing the noise above the QRM in the receiver. Finally, there is the problem of measuring the impedance at the antenna terminals (not at the transmitter end of the coax) which means you need a remotely controllable impedance meter that is portable enough to carry up the tower.

What I ended up with was a homebrew noise bridge with a high pass filter to block BCB QRM and a high power noise generator to overcome ham QRM. I implemented the "R" and "X" controls with varactor diodes so I could remote control it from the shack. I think I later saw something similar written up somewhere (QEX?) but I can't remember where.

I calibrated the meter by putting known loads on it and noting the varactor tuning voltage. Fortunately, there was little interaction between R and X.

I determined that the impedance of a 130 foot wire (#14) at a height
of 55 feet, fed from the end is 2500 ohms on 80 meters and 900 ohms
on 40 meters. (The tower w/tribander is the counterpoise in this case.)
If you trim the length to center it in the 80 meter CW band (3525),
it resonates up around 7500 on 40, requiring a series
or shunt capacitor to pull it down to 7100. I built a tower mounted
transmatch based on this info and it worked the first time!
I was also able to crank the tower up and down and observe that there
was very little change in impedance above 25 feet.

This is a common problem with regulated supplies. Especially with long wire antennas, it is common to see RF voltages in the hundreds of volts floating on the equipment. This is where having an effective RF ground on the station equipment saves the day. The Astron 35M has some RF suppression builtin. There should be a .001 cap across the output terminals and one across the 110v line along with three MOVs. Also there are three caps surrounding the pass transistors. Check that these caps are there and are good. I recently had a lightning strike come in and vaporize the cap across the AC line (and the MOVs). Interestingly all four pass transistors survived, but the .01 ohm 5 watt emitter resistors didn't. These act to equalize the current between the pass transistors AND act as the metering shunt. These proved impossible to get locally. One foot of number 20 wire has .01 ohm of resistance and works nicely as a replacement. You may have blown the LM723 voltage regulator in the supply with high RF voltages. It can only stand 35 volts. Try replacing it (use a socket) and be sure to check the caps and establish a good RF ground before tuning up again.

> [I mention how simple the 28a/h xmit out of band mod is]

>QUESTION... Is the IC228H the same as the 28H in this respect??????????

Maddeningly, no. The 28h is ridiculously simple, and the 228H is ridiculously complex. In fact, I have modified two 228H's and they weren't even the same as each other! They must have changed the design subtly without announcing it. Anyway, it's hackable by the means I mentioned in the last article, and with enough digging I might find where I wrote down the mod, to save you some time.

To give you some idea, the diodes in the 228h are the tiny one-or-two-to-a-three-leaded-surface-mount-device variety, mounted beneath the backup battery on the circuit board immediately behind the display panel! To do the mod it is necessary to remove the backup battery and carefully install (I think two) diodes.

The 28h requires only clipping one wire. Oh well, that's progress!

Hello again, netlanders! Today's question has to do with my Yaesu FT-470 and mobile operations. I presently use Ni-Cad packs for power when I'm mobile, but I really would like to get power from the car instead. I understand that the adapters made by Yaesu only allow radio operation at the lower (2.3W) wattage.

Has anyone ever seen/used a DC adapter for the 470 that allowed operation
at 5W

It couldn't have been an HP signal generator. Even before the first Lab
Prototype gets built, we specifically ensure that it can't be converted
to use as a bootleg transmitter. :-)

We have to quash this perception immediately, or HP will get a bad name !

Proper abbreviation of units is defined in ANSI Y1.1-1972 and ANSI/IEEE Std. 260-1978. A brief summary of the units in question are:

The letter K:

Use a lowercase k when the letter is the prefix for kilo or 10^3.

e.g., kW, kHz
written out, "kilohms" is correct

Use uppercase K when you are expressing the number 1024.

e.g., 64K bytes or 64 KB

Another basic rule is use a space between a two or more letter abbreviation and the number, but not between a single-letter abbreviation and the number. You see a lot of computer manufacturers who get this wrong with front panel labels that say "12MHz" or something similar.

e.g., 115V ac, 21.300 kHz, 10V

Q: Okay, what's this all about?

A: Current authorship for rec.ham-radio is in excess of fifty articles per day, sometimes much higher. The ideal USENET newsgroup is somewhat less than half of that.

Q: What's causing the surge in traffic?

A: Probably two things. First of all, growth in USENET readership. Secondly, the increase in controversial topics, which reflects the growing controversy within the hobby.

Q: So, why not have lots of splinter groups?

A: Two reasons. First, most people's interests in ham radio are reasonably broad, across various activities. Secondly, doing so would be a major pain for those who manage gateways to mailing lists. It's unreasonable to ask them to add more than two subgroups at a time.

Q: Okay, but why does packet radio get its own group, but not (satellites | ARES | microwaves...)?

A: Arguably, packet is the fastest growing subcult in ham radio. Almost everyone has a TNC. And, this usage generates lots of questions, given that packet radio, when done right, is not a trivial thing. Do we really want hundreds of "how do I set up my TNC with xxx" questions in the main tech group?

Q: But I enjoy seeing all the flames...

A: Well, then there's a group just for you now. In keeping with the .d

USENET standard for concussion, er, discussion groups, rec.radio.ham.d would provide an appropriate forum for discussing the various political topics that pop up regularly. Realize that most people really aren't interested in seeing long flaming discussions, and even those that like to get into the fray must refrain periodically to get some real work done.

Q: Why the tech / misc split?

A: Many people are interested in radio technology only, and not all of the nontech stuff (ARES, ARRL, etc). The tech / nontech split was the largest division I could come up with.

Q: So, when will this all happen?

A: Well, first of all, there needs to be a vote. I'll have to put together some automated votecounting software on one of the local vaxen. I'll try to get to that in the coming weeks. Assuming (from my mail) that the vote is positive, I'd create the groups, and give the mailing list hackers a month or so to do their conversions, as well as give everyone a chance to adapt to the new groups. Then the old groups would go away.

Sigh. The troubles are:

1. I only want to achieve 19200 baud. I have to either hook this up
to the ethernet port, which seems problematic, or a serial port and
run slip, which is the prefered solution, IMHO. Therefore, I
want to get two "black boxes" with RS-232 ports that look
like a 3-wire RS-232 cable: Full duplex bitstreams.

2. I live in a condo. The best I can do is MAYBE a 5 element loop
beam. I'd like to get away with even less. However, the OTHER
end will be two stories up, and can have as good an antenna

as I want. The antenna will be near some trees, but it won't be in jungle-type foliage. The terrain between there and here is flat as a pancake. If I could get to the roof at my house, I wouldn't QUITE be line of sight, but pretty close.

>Or maybe use unrestricted frequencies - visible or IR light. A couple of
>pairs of binoculars with light emitters (LEDs) and photodiodes at their
>foci might make a dandy full-duplex link. The antennas are the right
>size :-) I've always wanted to try this out but never find the time.

More than 5 GHz is right out, unless I can get a very lucky bounce. I have one idea: My bedroom window is 20 feet from a telephone pole. A wire to this pole is not possible, but how about a dish aimed out the window towards this pole (there's a garage between the window and the pole :-( ), and a dish on the pole with nothing attached to it -- using the dish on the pole as a passive reflector? I'd have to do it at night, but with help from a couple friends, I bet I could get the dish just below where the real cables are, and I bet the phone and cable companies would leave it alone. Would THAT work? The pole is almost 180 degrees off the bearing to the other end. What happens when you put a glass window in front of a feed horn? Bad things, I trust.

I wouldn't be so paranoid about putting an antenna outdoors, but I used to be on HF, and that got all sorts of attention. I am definately being watched. :-)

Life gets complicated, no?

On a partly related note: Is my "44" TCP/IP address good on the rest of the internet? Should I ask for two "44" addresses when I get on the internet: One for the SLIP, the other for the KISS? Or should I just keep it simple and get an address from my internet feed's zone (they have 3 nodes on a class B. Stupid) for the slip, and use the "44" for the KISS? (the IP address assignment hasnt' come through yet, but it will, of course, start with "44").

The Yaesu adaptor I use with my FT-470 (the only auto adaptor offered as far
as I know) operates the radio at a full 5W. However, it can only charge
the low-power batteries.

I must tell you a story about a radio hobbyist friend of mine that we call the "can man". How many CAN's can you find in this picture?

When I first met him, he was demonstrating the beautiful tube type 60W AM broadcast transmitter he had crafted. It was connected to a CAN-tenna dummy load. A walk around to the back of the rack revealed that the final grid tank was shielded with a coffee CAN, complete with a tiny hole for the neutralizing capacitor.

Next he showed me some other device he had made...I think it might have been a receiving converter. Anyway, the circuit was constructed entirely inside a coffee CAN, with coax connectors mounted to the lid.

But the kicker was when he showed me his homebrew 40M CW rig ... his code key was a bent coffee CAN *lid*, which you could tap against a nail in a piece of wood! Don't laugh...we worked CANada easily!

David,

friend of a can radio operator

>Okay, I've never done it. How does one execute a drilled-hole mount?

>I have a dual-band (2m/70cm) antenna with a PL-259 connector on
>the end of it. I somehow must make an SO-239 available on the fender.

>How do you drill a hole without messing up the paint? Is there any
>danger of the paint chipping? (my car is 4 months old)

I used a Greeley (Spelling?) punch. You drill a small (1/4 inch) hole
and insert the screw thread of the punch through the hole. Spin on the
cutting die of the punch on the screw and tighten with a wrench until
the large hole is cut. (This asumes you can get at the other side.)

>What kind of SO-239 do I need?

I used a standard chassis mount type with 4 mounting holes. I used
sheet metal (self-tapping) screws to mount it to the car.

>What needs to be one to the edge of the hole to prevent rusting and
>galvanic reactions?

I made a rubber gasket to go under the SO-239 to keep water from leaking in.
(I think I used a piece of an old bicycle inner tube.)

>How do I ground the mount to the car?

I just depended on the connection thru the sheet metal screws.

>Thanks!

You're welcome!

Well...I started this monster (as far as the CA question is concerned)
and I think it wound up drilling antenna holes in my car!?? Anyway....
I placed a call to the DMV office in Mountain View, CA and was told:

$21.00 fee for getting the plates; you must fill out the Radio Call-Sign application (this applies for both CB and Amateur I was told.... that's a laugh!); present to DMV - application, current registration, current FCC License, current auto plates, and monies.

The kind person at DMV even offered to send the application to me!

She also said that if your registration is due within 60 days from filing the application, that you must also pay your regular registration dues!

Thanks to all for your kind responses....

trop (Troy), N6XMV, WAC8900 (marine), and KBNP 1080 (yes.....CB, deceased)

In 1982, I successfully got (and still have) WB2GOH oh my car as a ham plate. The clerk said, shouldn't that be a six? I said, not any more, the FCC no longer requires you to change calls when you move.

He filled out the form and the plates showed up one eternity later.

The cost was $20 to obtain the plate, and nothing special to keep it.

This afternoon I'm going to bravely go down to the DMV and turn in WB2GOH, reordering it as a motorcycle plate. I'll report back if it's anything other than $20 one time fee.

I repaired an RS-20A once for a friend of mine who had the same problem you describe. He was using it with his ICOM 751A. As he raised the RF power on the ICOM, it would hit a treshold when the power would cut back and the voltage from the supply would drop.

The problem was one of the 2N3771 pass transistors (on the back heatsink). The socket that encapsulated the emitter and base leads did not make a very good connection and could not handle even a light load (like your 5 W situation). So, as a first look, check the connections to these transistors.

Also, since these transistors are, in essence, connected in parallel, you might try removing all but one (I believe there are 4 on the RS-35M?) and see if your voltage returns to 13.8 V (no load connected). You could replace one at a time to see whether one is not working.

Good luck -- hope this helps.

I don't see the analogy with other Usenet groups. For example, rec.humor contains jokes, while rec.humor.d contains discussions about the jokes. But rec.ham-radio doesn't contain ham radio; it contains discussions about ham radio. How would we distinguish between normal discussions and those that should be moved to a side group?

>Q: So, when will this all happen?
>
>A: Well, first of all, there needs to be a vote.

Will this be a vote on all the suggested newsgroups at once? What if someone agrees with some proposed groups but not others? And what if the failure of one proposal affects the required charter of the other groups? Seems like it would be difficult to take votes on the whole slew at once.

Also, is this going to work for the folks on INFO-HAMS? Will they still be able to get everything they want? I haven't seen that question answered since it was first raised.

Patty

Hey, Dudes -

Now that it has been clearly demonstrated that Ham Radio is not mentioned in _Pump_up_the_Volume_, why can't we just let it drop?

Is there anything to be gained by turning this thread into ANOTHER flame battle about licensed/unlicensed transmitters?

If you guys want to duke it out again, how about sharing your thoughts directly with each other and spare the rest of us?

Mike

Sorry to post this, guys, but I can't email from this location.

To: Gary, N9KAW

Gary, I have had the same problem with my Astron 35M. The SCR in the unit sees the RF as an overvoltage and crowbars, shutting the output down. Turning the unit off and on again resets everything. I solved my problem by wrapping the DC leads going to my xcvr around a toroid.

Yes, it is called rec.radio.shortwave; it was created several months ago.

Antenna fixing; go drill a hole! Having played with mag-mounts and hatchback
mounts etc. i eventually bit the bullet & got out the hole saw.
Some magmounts have an annoying tendency to 'walk' across the roof on long
journeys (my 72MHz 1/2 wave whip would crawl from the center right to the edge
of the roof after 200 miles at 80-85MPH). With proper mounts, no problem.
I fitted one through the roof (using the dome lamp as access) and one in
place of the broadcast-band antenna on the rear panel. The roof
mounted antenna base is fitted with a square reinforcing plate behind to stop
metal flexing; the other mount is on a panel that is sufficiently curved to
be quite rigid enough for VHF antennas without any reinforcing plate.
If drilling holes, make sure you know whats behind; Its so easy to go
through wiring looms, or break through into a double-thickness panel
with no access. I have even heard of people finding where their gas tank was
with the end of their drill bit. If in doubt, leave it to the professionals..

>in the US? NIST? Congress?

Neither. The metric system has been the legal basis of measurement in the US for over 100 years. It's just that the traditional system is also still legal. The traditional units have their legal definitions in the metric system.

We have met the enemy, and he is us.

At least the sorry history of the metric system in the US gives hope with respect to the OSI "transition". If government exhortations have failed to make us adopt the metric system, an international standard that really IS widely used in the rest of the world and is clearly superior to US practice, then they're even less likely to get us to toss out a proven set of computer networking protocols in favor of a so-called "international standard" that exists only on paper and is in many ways inferior to present practice...

Golly, batman, you mean you want a non-ham solution? Buy a GEMLink.

Oh, you want a ham but non-packet solution? Buy a GEMLink and move it into a ham band, then run a pair of trailblazers over it.

A long coaxial cable?

Infrared? No license required, and it's RF of a kind. Check the Edmund Scientific catalog.

For CA:
  It's obvious that CA DMV offices are not with the program since by various postings here, CA call plates can cost anywhere from about $17-25 and sometimes, but not always, require a one time processing fee. Typical of most state bureacracies.

For OR:
  I got my call plates in 73 and have transfered them around ever since. initially, I paid a one time 'transfer of registration' fee of $5 each time I transfered the plates to a new vehicle, then paid the regular $20.00/two years fee (recently gone up to 30.00). I did the paperwork at the local DMV office. At the time I got them, you could only get the 7 call area on your plates. I don't know if that is still in effect or not. An interesting note: when I first applied for my plates, I asked for amateur call plates. The clerk was confused for a minute, then told me I could only get ham callsigns on plates. He wasn't aware that ham and amateur were the same. He went on to explain that the law specifically prohibited CB call signs on license plates, even the vanity ones ($60.00 extra per year). Once I convinced him ham and amateur were the same, all was well. They gave me a temporary tag and I got my call plates about four weeks later. Every time I go into a new town in Oregon, the cops always run my plates because they quit making that color of plates in about 75-76 and they're now on an 86 van. What fun!

For MI:

  All states are different. Here, the local Sectretary of State office handles registrations for vehicles, however, not for ham plates. you must first register your vehicle in the normal way, then call the state office in

Lansing and request an application for ham plates. Fill out the application and return it with a copy of your license. They will send you the plates and bill you the regular plate rate plus a two dollar processing charge. You then take your old plate to the local office for a refund of that plates fees. After that, you renew it yearly just like normal plates. Michigan has no restrictions on call areas. Now I have two vehicles one with Oregon plates and one with Michigan plates, both with the same callsign. (I can keep the OR plates since I'm in the military). More fun!!

73,
Michael

I am going to Florida the end of next week and will be bringing the IC-24 with me. Does anyone have frequencies that are used in that area that would be interesting to listen to? I figure I would scan the "normal" bands for aircraft and such. Assuming the 24 would recieve it ok. It does well for 120-130 aircraft band.

Thanks for the help.

I suppose you should be able to epoxy glue several AM rods end-to-end
together. Ferrite is (or used to be) some sort of magnetic material that was
ground up, mixed with an insulating glue, and molded into useful shapes.
Being ground up reduced eddy currents.

commercial map makers introduce little errors into their maps to trap other
mapmakers that might pirate copy the original. If the second mapmaker's map
has the same error, than it is obvious that he pirated the info.

I don't think I've explained this before in this group, but there are several difficulties in the way of using ham radio to connect to the internet. In no particular order:

1) The CATENET structure of the internet requires that there be a single logical gateway between two networks. This implies that a network is fully internally connected; the AMPRNet is not.

2) Lacking a fully internally connected network, only one of the clusters of hosts could be connected and the others would NOT be connected, but there is no way to advise hosts attempting connections to network addresses except to return "host unreachable" ICMP messages. Since these do not contain an "expected return to service" timestamp, it is not possible to advise that the condition of unreachability is a PERMANENT one.

3) There are legal restrictions in the USA that prevent packets not originated by hams from automatically keying a ham transmitter for transport to your station. Other countries lack third-party agreements that would allow them at all. Complex schemes of authorizing transmissions might make this legal but they would be cumbersome and cannot be guaranteed.

4) There are content restrictions on ham radio transmissions which

probably require manual screening of content. Unrestricted packet
exchange between AMPRNet radio-based hosts and the rest of the internet
could well run into this restriction.

However, all is not dark:

You could apply for a class-C internet network number assignment from
the NIC to avoid problems 1 and 2 above, and devise some remote control
and filtering gateway to avoid 3. There are people who are doing
this in various places; I suspect to some extent they are relying on the
FCC simply not catching the occasional slip they may make. Probably
they are right: it's almost always easier to obtain forgiveness than
permission.

[Story about helping out the EMT after a backpacking accident and helping people in the backcountry contact relatives deleted]

During the recent Yosemite fires, I overheard a conversation between a ham on the top of Half-Dome Peak with a bunch of boy souts talking to a ham here in the penninsula (Redwood City) via one of the local repeaters. The guy in Yosemite knew about the fires, but after traveling all the way from southern california, elected to enter the park anyhow (apparantly the west side of the park never closed). Anyhow the ham in Redwood City set up a phone patch lash up to the other guy's parents who were in Oakland. Apparantly his parents were real pleased to hear from him and to find out that they were safe away from the flames. It was pretty neat.

Does anyone out there have any reasonably up-to-date information on the current thinking regarding possibly negative biological effects from handheld transmitters (e.g. 2m and 440-450 Mhz units)? In particular, the effects on eyes (cataract and vitreous) and other biologic effects (e.g. brain effects).

At one point, the literature seemed to imply that eye effects were worse as the frequency went higher, and that brain effects (possible cancers, etc.) were centered around the 400-500 Mhz UHF region.

With the increasing use of handheld units with stubby little antennas and higher power (such as five watts, compared to older units that typically ran a max of one watt) these issues seem to be of increasing concern.

I believe Wisconsin is one of the states where you can actually have two and maybe even more cars with the SAME PLATE number if it is a HAM PLATE.

At the risk of starting another no-code flamefest which devolves into tedium...

At a dinner party for some visiting Japanese friends last night, I was delighted to discover that one of the visitors was a ham. Part of our eyeball QSO touched on comparing notes on the different license classes in our two countries. He said the most popular license in Japan is what he called "Novice Radiotelephone", which has no code requirement, but a significant theory exam: essay questions at the level of impedance, resonance, etc. The privileges are 80M, 40M, 10M and VHF SSB, 10 watts maximum power. I was very surprised to hear of this, because of the oft-cited IARU regulation requiring CW exams for HF licenses, but he insisted that this is the case. (He also mentioned that some of these hams run "Tokyo 10 watts", nudge, nudge, wink, wink, say no more...) I believe he said they also have a no-code license with a tougher theory exam and more VHF privileges.

In his experience (2nd class license for 15 years, DXCC on 40 SSB), the no-code licenses have brought in a lot of hams who upgrade to the higher classes as they get involved.

Of course, if you think about it, CW is not going to be real attractive if your language is not based on an alphabet. He said the higher classes which require code tests use the Roman alphabet with Int'l Morse, but that the top class also requires skill at the Katakana code. Katakana is a kind of larger alphabet with a symbol for each syllable. Katakana Morse has some pretty long characters, so Katakana QSOs use lots of abbreviations.

I have been refered to Ham Radio (RIP) magazine's December '89 issue, where a 10 GHz system that fulfills almost all my requirements. Inquiries are pending to the author(s) for PC board layout(s). Even if this doesn't work, it'll still be a nice thing to have laying about, as well as a matter of pride, etc. This leads to some further questions:

1. Of course EHF is dangerous, but is there any way to effectively quantify the hazard? This thing aparently puts out about 10 mW of power, which, with the dish, means about 10w of ERP with a 4 degree half-power beamwidth. What kind of biological hazard is posed by standing behind the dish, to the side of the dish, and in front of the dish? How close to the dish in the directions I've mentioned is considered safe? I want to be safe about this, but I'm unlikely to be able to put this thing too far away from people. If that's not safe, there's little point in proceeding.

2. The distance measured on a map turned out to be about an order of magnitude higher than I first estimated (how embarassing!). The link is about a half mile, rather than 100 meters. With line of sight, this wouldn't matter, but without, is there any point in proceeding? We do get fog. How likely is that to interrupt a link of this distance?

3. If anyone has this article, how easy would it be to move the operating frequency of this device down? Sacrificing the bitrate is OK, since the design bitrate is about two orders of magnitude higher than my needs dictate. Along similar lines, what frequencies in the low EHF range would be acceptable for this project? This

question explicitely includes non-ham bands where licensing procedures would be either simple/cheap or non-existent.

4. If this doesn't work, I know a local repeater with a half-duplex autopatch. I could let them use/have/borrow this thing for audio and we'd have a full duplex patch. The article says this device has a theoretical link distance of 40 miles. How well does that theory stand up? How about with fog?

5. Anyone who is a 10 gig wizard, please send any advice you may have for a ham whose highest QSO of any substance so far has been 220 Mhz.

I guess that's all for this time. I want to thank everyone who has sent suggestions, and I'm sorry for getting a little cheesed about all the packet suggestions -- I probably should have been more clear in my original post.

```

The new Air Force One, a 747 with tail number 28000, has been delivered to the Air Force and is currently conducting tests prior to being used to carry the president for the first time.

It appears that this aircraft will use multichannel X-Band DSCS (7-8 Ghz) or millimeter wave (20 and 40 Ghz) Milstar satcom for its primary voice/data links to the ground, relegating the 225-400 MHz UHF-FM-FDM Autovon GEP circuits and the 415 MHz NBFM "Nationwide" circuit to the same low priority, infrequently used, backup role as the traditional HF SSB "Mystic Star" channels that are still kept up to AF-1 for communication coordination and emergency backup.

This means that in the next few days a 27 year long era will draw to a close for radio hobbiests; it will no longer be possible to listen in on much of the telephone traffic (almost all but the secure satcom) from the presidents plane as it flies overhead. This marks the passing one of the last "in-the-clear" federal communications systems carrying genuinely interesting traffic that can be monitored with simple equipment; although the UHF-wideband FM GEP Autovon and nbfm Nationwide circuits will supposedly still be maintained to the plane and may carry occasional traffic, it will likely be very low level, routine, and infrequent.

For many years (from the 60s to the early 80's) the secure circuits from the plane were often of such poor quality (1200 baud vocoded voice was used for several years using first generation vocoders designed in the 60s) that many presidential calls were routed over the Autovon and Nationwide channels, and even in the last few years quite a few presidential calls have showed up on these clear circuits, especially on the Autovon (the "Alpha" and "Bravo") channels. For those who enjoyed such things and knew about how the circuits worked there was some interesting listening, especially in the early days of the systems before the introduction of usable secure satcom for high level calls.

So thus passeth into cryptographic obscurity one of the most interesting remaining open federal circuits. Soon the only interesting easily received US government signals in the clear will be NOAA weather broadcasts, NASA Select TV and Wefax transmissions. I am sure that there are those at NSA, IRAC and the White House Office of Telecomunications Policy who are saying it's about time this was true.

Back in the late sixties there was an outbreak of 3 Meter QSOs in the Copenhagen Denmark area. At that time in most of European radio was still a gummint monopoly. Part of the wisdom of the gummint said that the FM band could only contain 3 or 4 local stations without adjacent channel and co channel interference. Like once a year for 3 hours when the sporadic E was so good you could hear Italy and France on the VHF FM Broadcast band. Well, you could hear this stuff because the bands were so under used.

Some local ham types, mostly unlicenced, were tired of tuning their B&O FM radios up and down a band that only offered "Program One, Two and Three". Really imaginative folks down at Radio Denmark. All that empty spectrum. They had the receivers, they had the antennas. All they needed was the transmitters. Thus the "Tre Meter Band" was born. Using PA mic amps and simple tube transmitters deviating +- 75 kHz real hi-fi QSOs were held around the Copenhagen area. Some of these signals were excellent with the pirates priding themselves in their hi-fi signals using Sennheiser mics etc. For some reason this was all chat, no one thought of connecting a turntable - that I heard - and spinning a Victor Borge or two.

After a few months it came to an end. The local Post and Telegraph paid a visit and all the fun went out of it.

A couple of the leading lights of the "Three Meter Band" became excellent RF designers and put out some nice Two Meter kits as well as getting real jobs with one of the local two-way manufacturers.

Punching a hole from the "BAD" side to the "GOOD" side using a Greenly
punch without scratching the paint with the die (the cup shaped piece)
is no problem if you interpose a piece of cardboard between the die
and the finished surface. The small punch burr is no problem to clean
up if needed, just chamfer the hole with a knife. Using this technique
you need not find "wrench room" on the back side, only access space and
clearance to get the punch piece to the worm. I use the cardboard
usually found on the back of note pads and writing tablets, this is
sufficient protection for common chassis material, with the thin sheet
used in today's cars you can even use "oaktag", you know, the stuff
they make file folders of, heck, even a cereal box will supply the
required material.

```

A few months back there was some discussion of Mr. Maurice Hately's (GM3HAT) Crossed-Field Antenna ("CFA") designs, as was originally described in the March 1989 `Wireless World' ("WW") Magazine. Since that time I haven't seen/heard anyone saying anymore about the antenna.

About a month ago I wrote a letter to Mr. Hately (in Scotland) and, received a nice reply from him last week.

In his response to me Mr. Hately enclosed a two page brochure, covering his CFA offering to the amateur community. In addition, he sent me a color (should I say "colour"?) photograph of an experimental medium-wave (I think 360 Meters wavelength) CFA that's being tested by Radio Cairo. Mr. Hately wrote (on the back of the photograph) that the CFA was providing a better received signal (no details given on what kind of test instrumentation) than a 75 foot vertical had given (admitedly, if my recollection of the 360 Meters wavelength is correct, then a 75 foot vertical is quite short).

I suspect that a lot of hams/engineers had the same first-reaction to the CFA that I did; "it's too good to be true". It was last year that we all got our hopes up when the `cold fusion' announcement was made, and there's been a lot of disillusionment over that. So, I think that there's a tendency to dismiss the CFA, partially as an attempt to prevent another hope from being dashed on the rocks of reality.

When I'd written Mr. Hately, I had mentally prepared myself to spend up to a few hundred dollars, to provide for the expenses of getting a CFA in-hand to test (OK, play with). I got a bit of a shock when my eyes made it to the `bottom-line' in the CFA brochure. Unless my math's really off-base, it'd cost a Stateside ham around $800 (U.S.) to purchase the amateur version of GM3HAT's antenna. I fear that price is a bit too steep for me to seriously consider directly buying a CFA from Mr. Hately at this time.

I'd like to find out if anybody else has looked into the CFA's operation, more specifically concerning the matching/phasing requirements of the `splitter' that feeds the `capacitor plates' (generating the E-field component), and the `top hat/ground plane' (generating the H-field component)?

It's my guess that a large portion (after excluding shipping costs, which are not trivial) of the price of the amateur CFA goes to the tuning-up of the antenna matching/phasing `box'. From Mr. Hately's brochure, it appears that the `match-box' consists of a SEALED (my emphasis) box, with one coax input (going to/from the radio), two coax outputs (one to the `capacitor', and one to the `tophat/ground-plane') and, the front of the box is COVERED (my emphasis) with what appear to be toggle switches. I suspect that the CFA may take a fair amount of initial set-up time, to find the right matchbox settings, to provide the correct amplitudes/phases of signal driving the two portions of the CFA.

Does anybody `out-there' have any experience with CFA's?
Has anyone else looked into the CFA operation, and if so,
what conclusions have you come to?

If it were feasable, I'd like to build a CFA and write an article on it (perhaps for a publication like `QEX'?). I'm not aware of anything having been written-up on the CFA in the amateur literature. I haven't researched the professional publications (IEEE) but, I plan to go through my company's technical library, to see if there has been any further published information on the Crossed-Field Antenna theory/design (I doubt that I'd be able to follow the theory ... Mr. Hately obviously has a very comfortable relationship with Poynting Vectors and such ... I VERY DIMLY remember such things from an electromagnetics course years ago).

Feel free to respond directly to my InterNet address, or if you think
that your comments might be interest to the rest of the INFO-HAMS
group, go ahead and post your comments to UCSD (please copy me directly
if you do so; sometimes I get `dumped' off INFO-HAMS by Brian's computer,
and it takes me a few days to realize that things are too quiet!).

Thanks to one-and-all.

Paul Nix (WB5AGF)   InterNet: nix%muppet.decnet@consrt.rok.com

Does anyone have the expanded receive coverage mod for the Uniden
HR-2600? Or, the HT-2510? Thanks!

73, Paul

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
10-11	International Designator (Last two digits of launch year)
12-14	International Designator (Launch number of the year)
15-17	International Designator (Piece of launch)
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Julian Day and fractional portion of the day)
34-43	First Time Derivative of the Mean Motion or Ballistic Coefficient (Depending on ephemeris type)
45-52	Second Time Derivative of Mean Motion (decimal point assumed; blank if N/A)
54-61	BSTAR drag term if GP4 general perturbation theory was used. Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63	Ephemeris type
65-68	Element number
69-69	Check Sum (Modulo 10) (Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3

Column	Description
01-01	Line Number of Element Data

03-07	Satellite Number
09-16	Inclination [Degrees]
18-25	Right Ascension of the Ascending Node [Degrees]
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee [Degrees]
44-51	Mean Anomaly [Degrees]
53-63	Mean Motion [Revs per day]
64-68	Revolution number at epoch [Revs]
69-69	Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

```
NOAA 6
1 11416U          86 50.28438588 0.00000140           67960-4 0  5293
2 11416  98.5105  69.3305 0012788  63.2828 296.9658 14.24899292346978
```

Note that the International Designator fields are usually blank, as issued in the NASA Prediction Bulletins.

I tried mailing this directly, but got a mail error:

```
# Trouble sending mail on `crash',  Fri Aug 31 12:41:33 1990
#
# ============ Transcript follows ============
#   GUHSD000
# 0 alias errors
# No local user named "GUHSD000"
```

Perhaps it's a case problem, although I sent it in lower case. So, the rest of you can skip this if you choose....

In article <4182@crash.cts.com> guhsd000@crash.cts.com (Paula Ferris) writes:

> It's a govt bander, but in theory, it'll work in 2m as well, and I
> know it will operate at least as high as 170Mhz, and low as 155Mhz,
> and will store (but not always accept/operate with) values as low as
> 101Mhz.

I have the programming book from Bendix King for the VHF and UHF walkies and mobiles.

I believe that some of their radios can operate from 138 to 174 MHz, continuously. However, not all of their radios can use the entire range: some cut out just around 163 MHz, some won't go below 148 MHz, etc. Basically, you need the model number or just have to try it. I'm not aware of any hardware modifications which might expand the coverage, if any. If anyone knows of any, I'd be interested in hearing of them. Of course, I need to retain FCC type acceptance, so these probably aren't likely.

> What I need is a information on "secondary programming mode" and I
> need to know the meanings of options 1 - 12345 and 2 - 12345, as well
> as involk dtmf mode (Little Phone Reciver on display).

I'll bring in the information on Tuesday and send it to you (if you'd like to send me a good address), if you haven't found it by then. Although it is probably equipped with the keypad on the front, it does not necessarily have DTMF capability. King could learn something from the Amateur arena here. If it does have the hardware board, it can be enabled in the secondary programming mode.

> Why: A friend of mine is a Chief in a Vol. Fire Department in Minn.,

> repeaters/ phone patches, and has to carry this radio whenever he's on
> standby, the radios have 14 channels, but his area only uses 8 for
> everything, including fire, law enforcement, etc... He's a ham, but
> doesn't own a HT of his own. So right now, the only extra feature
> he's added is NOAA weather (with scan bypassing, for good reason).

Geez, if he wants to sell one of these, I'm in the market. Okay, since I'm posting this instead of mailing it, if anyone wants to sell one, please send me mail. Although I'm in an area which uses more than the 14 channels, I like the Kings. They're more easily field programmable than some, which is a bonus on some of our multi-agency calls. Yes, it requires something external to the radio, so it meets the applicable FCC requirements....

Mike

If you ever get the chance to visit a LORAN C transmitter,
by all means do it. I saw one on the northwest coast of the island
of Hawaii last December. The finals ran about 15kV at 30A (450kW)
to a large (300meter high) loaded vertical. There was enough stray
RF in the transmitter room that the technician could make a nice
fireworks display by running a screwdriver over the gap between the
19" rack panels and the rack (yes, they were connected together, but
the 6" gap between screws was enough to make nice sparks). I could
hear the transmitter on the car radio for miles! Great stuff!

So far, every icom rig I've tried this on (02at,04at,micro2at,2gat,28a,28h,228h) is easily modified to transmit over its entire receive range. I could post what I've found out so far, if I could find it, but it's relatively easy to hack out your own mods.

Yer usual DISCLAIMER:
This posting is just general hints ... not step by step instructions.
This requires specialized tools and knowledge...and patience and care!
Try only if you have a teeny pencil type soldering iron, experience with surface mount boards and components, and feel you won't mess up your radio.

Still here? Ok...

If you examine the schematic, you'll see that connected to the processor is a diode matrix. Note the positions of all the diodes. You'll need to figure out what traces on the board correspond to what lines on the schematic.

Now carefully remove all the diodes (these are usually surface mount, sometimes each chip has three terminals, and may have one, the other, or both diodes present), and attach fine wires to each row and column of the matrix (following those traces is the hardest part!).

Now make your own diode matrix of the same size, on a separate board, but put dip switches in series with all the diodes. Any old 1N914 or equiv will do nicely. Be sure to use very fine wires to solder onto the icom board, watch out for static damage, observe polarity, etc.

If all goes well, you now have a switchable diode matrix. The matrix is read each time the CPU is reset. So reset it (check the manual for the radio in question) after dialing in the original matrix positions. If all goes well, the radio should behave normally. NOW -- flip one switch, and try it again. Pretty soon you'll know exactly what change each switch makes. One will let you xmit out of band. One will change the standard channel step spacing. One will change the coverage (for european models, shown in the schematic as an alternate), etc.etc.

Once you have hacked out the proper settings, just solder in diodes to permanently program the radio that way, and put it back together.

Hmmm now it doesn't sound that easy when I describe it, but I've done it countless times, with the owner of the radio hovering, and so far it's always worked. Note also that the matrix board you make is reusable...new icom? just break out the ol' switchable matrix board!

One notable exception...to get the 28a/h to xmit out of band, you just cut D21...no matrix programming change required. It's a different design, and it's easy to see what's happening in the schematic. Oh...and there are two D21's in the 28a/h...get the right one...the wrong one is in the backup battery circuit and clearly has nothing to do with the transmitter portion.

The icom 735 is also a one wire mod.

If you are considering this with any of the radios I mentioned above,
email me for the mod to save yourself some time...but I'll bet you when
someone sets a new one on my bench, the same old faithful trick will
work again!

To Gary and his Astron power supply.

Yes Gary it is very possible that your supply shut down because rf was getting into it. The power supply on my Drake TR-7 does the same thing when my antenna is not tuned correctly and rf is in the shack. The capacitors you talked about and I'm not sure from your posting if they were installed in your supply or not are probably bypass caps to reduce the susceptability of your supply from rf.

It is possible that the power supply leads are acting as antennas and picking up rf in the shack. Try to put a sleeve of ferrite over both leads. This will reduce the common mode noise that is the rf common to the plus and minus leads of the supply. If you need more info try to call me. I tried to e-mail direct to you with no luck.

Are these the same rules that require you to identify with your FCC assigned callsign even though they stopped assigning callsigns years ago.
I realize there is a supposed formula for fabricating callsigns now, but that kind of defeats the purpose of having FCC assigned callsigns anyway.
And when was the last time you heard of anyone being cited for failure to identify.
The CB regulations are like any other un-enforced law. When you let people

ignore one law, it weakens all the others too.

Here in Maine it is also same as vanity plates, $20 per year.

Incidently, when I was in CA (75-77) they would not issue plates
with out of state calls. I was WA2JAM at the time. I guess the rule
was if the first character was a K or a W and the 2nd or 3rd character
was other than a 6 they would not issue. I got around it by using
my bicentennial call AA2JAM and taking them as vanity plates. Is this
one still in force? If so then there's a spot for you CA hams to
ticlke your state government on. Are there any states which will
not issue for "out of state" calls?

I had no trouble in either Utah or Maine, just submit a copy of
my station licence.

What good is a hard hat when your body gets crushed by a 200 pound chunk
ice?   Is this an easy way to turn a hard hat into a pizza pan?

LORAN-C User Handbook U.S. Coast Guard, May 1980. COMDTINST
M16562.3 Available from Supt. of Documents, U.S. Gov't Printing

Office, Washington DC 20402. $7.50 (in 1983).

Covers the basics of LORAN-C and has maps and parameters for all the transmitter chains active at that time.

The Aviator's Guide to LORAN-C by John F. Good, Aksunai Press,
Box 326, Wakefield MA 01880 (First ed. 1984. No ISBN. $12.00)

I bought my copy from Sporty's Pilot Shop but they now say it's out of print.

This is the best LORAN-C book I've seen, with excellent descriptions for technical and non-tech readers. Tells how to install receivers in planes and cars.

Chapter 10 is a fascinating history of hyperbolic position-finding. LORAN-A, the bane of the 160m ham band, was phased out (so to speak) in the early '70s. LORAN-B was LORAN-A variation which was never deployed. LORAN-D is a low-powered military tactical system which is compatible with LORAN-C.

The Wild Goose Association is a LORAN equipment manufacturers' group which is of little direct benefit to individual users.

LORAN-C is on 100.0000*** kHz; it's controlled by atomic clocks and can be used for a frequency standard. On audio, it's a rhythmic clattering sound like a motor with bad bearings. The pulse sidebands extend more than 10 kHz either side of 100 kHz.

LORAN (acronym for LOng RAnge Navigation) is lots of fun, and becoming more affordable. K-Mart now sells LORAN receivers for $329 (but you can get the same model by mail order for about $300; see boating magazines). Most receivers come with books which explain the principles.

LORAN has direct ham-radio applications: It's useful for determining antenna and repeater performance, since it constantly tells you the bearing and distance to any fixed location ("waypoint"). It indicates latitude and longitude, for ham activities where grid squares are important. Add an altimeter, and you have a 3-D fix.

The satellite-based GPS navigation system is superior to LORAN but there are not yet enough satellites in orbit to give 24-hour coverage, and receivers cost at least $3000 (predicted to reach $500 in a few years.

When buying a LORAN receiver, be SURE it contains the necessary firmware for using the new transmitters which are supposed to go into service this year. (Don't take the salesman's word for it.) Otherwise, it will need a ROM upgrade (maybe not available for used units no longer in production). See _Aviation Week_ magazine, Sept. 28, 1987, p.120 for info about the new stations, which will extend LORAN-C coverage in mid-USA and southern Canada.

>This receiver requires 3 signals to get a fix; is there
>any way I can do it with just two?

Two stations (master and one secondary) establish a hyperbolic line of position, i.e., you are somewhere along a curve some number of microseconds from the master station. To find where, i.e., a fix, you must have two lines of position and find where they cross. If you already know that you are along some known line, like an interstate highway, then you can plot a fix with only one set of raw LORAN numbers (microseconds), but is usually isn't worth the trouble. Before microprocessors were available, LORAN receivers indicated only microseconds, and you needed a special chart to plot position. When I use LORAN in my car, I sometimes use (for example, when travelling east/west) only the longitude readout for finding my position along a road. To calculate Lat or Lon, however, the receiver must receive three stations. Some super-expensive LORAN receivers for aircraft track more than three stations simultaneously.

TRAVELS WITH LORAN-C

by Frank Reid W9MKV

[published in _The Lowdown_ (newsletter of the Longwave Club of America), June 1985.] [Abridged in this posting.]

For two years, I've experimented with Loran-C for land navigation, including a perhaps unusual application, that of locating and recovering cave entrances and other karst features in dense woods in Indiana and Kentucky. The high resolution and repeatable accuracy have been adequate for finding very small holes in areas where visibility is 100 feet or less.

The Micrologic ML-5000 Loran receiver is highly portable and requires only 0.6 amp with its lights off. Within Loran's basic limitations, the device has been altogether satisfactory for automobile use, which must be a worst-case application. I've measured locations of 200-mile-distant road intersections on aeronautical sectional charts, and consistently had the waypoint-arrival alarm sound when within sight of the destination (arrival alarm radius set to 300 feet). I anticipated using my receiver for air navigation to supplement the ratty avionics in rental planes but the unit's size and shape make it unsuitable for temporary mounting in small aircraft. The ML-5000's ability to store alphanumeric waypoint names is a tremendous advantage, eliminating the need to refer to a separate list.

Another Loran I've used, a II Morrow "Apollo" installed in a friend's airplane, has been disappointing, at least in my region. It does not select stations automatically, and requires special settings when in areas between transmitter baseline extensions. The baselines and extensions radiating from the nearby Loran transmitter at Dana, Indiana, make the II Morrow unit very cumbersome to operate when travelling in most directions. To alleviate the problem, my friend uses the Southeast Chain (which does not include Dana) instead of the normally-more-suitable Great Lakes Chain. The decrease in repeatable accuracy (300 feet instead of 100) is not objectionable for VFR flying but, as Indiana is a fringe area of the Southeast Chain, weak signals sometimes cause the unit to reinitialize in flight, an unpleasant experience. (Loran-C receivers require 2-5 minutes to acquire and track signals, and can do so in motion.)

Power lines are the major source of interference on land. Briefly driving under one causes no problem because the computer's position-determining process averages a large number of pulses. Driving parallel to a large power line for a mile or so can cause the receiver to lose track. It often becomes unusable in metropolitan areas. With the vehicle not moving, I have noticed large position errors (more than one mile) near power lines even when the receiver displayed no alarms. Power-line noise may have caused the receiver to cycle-slip (detect the wrong cycle of the Loran pulse).

While driving around Indiana on the first weekend of experimenting with my new receiver, it unexplainably lost track three times. I was then about 20 miles from the transmitting station at Dana, and decided to make a visit. Not wanting to risk preamp damage from strong signal, I disconnected the antenna 3 miles away. When I arrived, the Coast Guardsmen who man the station were too busy to give me a tour because the place had been hit by lightning and had been off the air three times in the last hour. They were using diesel-powered generators for continued operation at reduced output. The station is big! The antenna is about 600 feet tall, with a capacity hat of many long radial wires from the top. The Dana transmitter has 400-kilowatt output. Some Loran-C transmitters radiate up to 1.2 million watts.

I travelled through the "mid-continent gap" enroute to Wyoming in summer, 1984. Driving westward through Iowa and southern South Dakota, the repeatable-accuracy readout slowly increased to over 400 feet, and signal-to-noise ratios decreased but stayed within the usable range. (Decreased accuracy isn't a serious problem Out West where driving visibility is better than flying visibility back home! Sectional charts are a lot more informative than roadmaps.) Manufacturers recommend recalibration every 200 nautical miles, or after changing transmitters. Using an aeronautical sectional chart, I recalibrated at a road intersection in SD, my first recalibration since Indiana, and was two minutes off in longitude but perfect in latitude. There were no problems until I reached the Black Hills region. East of the Black Hills, the Loran remained on the Great Lakes chain, changing to the West Coast chain a few miles west, but within the Black Hills geological formation, signals from both chains were unusably weak. In Wyoming, it "derailed" for about 5 minutes as I drove under a thunderstorm. The unit functioned perfectly during the return trip on I-90, passing just north of the Black Hills. It automatically switched back to the Great Lakes chain near Rapid City, SD.

Parts of the mid-continent gap are marginal, others are truly unusable. Unsuitable station geometry causes poor coverage in most of Texas, New Mexico and Arizona. On a trip from Indiana to Texas, my receiver switched from Great Lakes to Southeast chain in Arkansas, and became unusable south of Dallas, near a baseline extension with no alternative stations available. I tried manually returning to the Great Lakes chain, but the signal from Minnesota was too weak. It seemed to work properly near Austin, and became unusable again just north of San Antonio. Southeast Chain signal-to-noise ratios were good in Texas.

A fixed Loran receiver can be used for DX'ing; simply set the GRI of a distant chain, wait for the receiver to acquire signals (which can take an hour or more), and note the signal-quality indicators. R.W. Burhans' Loran DX'ing method (_Lowdown_, January 1985) is superior, allowing visual signal comparison, and reception without master-station acquisition. Household power lines interfere, and best results are obtained with battery power and a long wire antenna in an isolated location.

As a caver, I just _had_ to see if Loran works underground! Through affiliation with the Cave Research Foundation, I was able to take the pack-frame-mounted unit (with 3-foot whip antenna) through a large passage in Mammoth Cave, Kentucky, stopping at USGS benchmarks to check position. The average depth was 200 feet. Signal strengths varied enormously-- At many locations, signals from Dana (173 nautical miles away) remained almost as strong as on the surface but signals from New York and Florida were unusably weak, so fixes could not be computed. 100 feet of extra antenna did not improve signals significantly, nor was cycle-stepping successful. At a place where water enters the cave through a vertical joint, all signals were strong; the computed fix was 1/2 mile east of the real location. Part of the underground route contained power lines for lighting, which are in metal conduit and buried. Their presence or absence had no noticeable effect on Loran signals. The lights were not turned on. I have taken the Loran receiver into two Indiana caves, with similar results.

Although Loran navigation seems not to work underground, there are interesting effects worthy of study; a simplified 100-kHz receiver could be used in caves to search for vertical joints, thin overburden or other anomalies.

Changes in ground conductivity cause local propagation anomalies, manifest as Loran position errors, near geological features such as sinkholes and escarpments, and probably faults and mineral deposits. Loran in conjunction with optical survey may be usable as a prospecting aid analogous to the ground-resistivity-mapping process but without the cumbersome wires and ground rods. (There are a number of geophysical techniques which use signals from U.S. Navy high-powered VLF stations. A useful reference is _Applied Geophysics_ by W. Telford, L. Geldart, R. Sheriff and D. Keys, Cambridge University Press, 1976.)

This is a continuation of the original Challenge which went somthing like:

In article <1382@necis.UUCP> rbono@necis.UUCP (NM1D) writes:
> *** I HERBY CHALLENGE THIS SILENT MAJORITY TO THE FOLLOWING ***
>
> Better than that, post
>them here so that everyone else who has the same bad taste about the

>bad attitude.

Before I begin, I couldn't let this one slip by. Doug, you had me blushing
as I read your artical... and you know that is not easy to do, I humbly thank
you for your kind words, but there is one thing that I must address:

In article <9008251524.AA05193@dt.Wellfleet.Com>, dtheriau@wellfleet.com (Doug
Theriault) writes:

[deleted some]

[deleted some more]
> Rich experimented with all sorts of modes. Why am I saying this?? I consider
> Rich MY Elmer... He gave me alot of support and help. He hated it when
  ^^^^^^^^^^^^^^
       This has me perplexed.... I often consider Doug to be MY elmer!?!?!?
He was licensed well before me, and I have fond memories of trying to squeeze
into the Ham shack (is was in a small closet) in high school while Doug was
operating CW on the Novice bands... and I was always asking:
 Who is that???
 Where are they???

What are they saying??
and other such anoying questions!!! Thanks for the fine memories Doug, they are still with me, and I still think of them as fond memories!!

Well, I have to say a personal thanks to Doug, he has to be considered one of the persons most responsible for me getting my 'ham ticket' and getting on the air... THANKS DOUG!

Ok, on to the CHALLENGE (I thought that I should be allowed to contribute also!)....

Don't ever listen to anyone when they try to tell you about all the fancy equipment that you need for various Amateur Radio activities. Ever since I was first licensed (not that long ago :-)), I have had a sort of romantic desire to be an active OSCAR (Ham Satelites) operator. There is just something about communicating through an orbiting satelite that is in OUTER SPACE via Ham radio that has attracted me. Maybe it is all those 'Lost-In-Space' and other 'Sci-Fi' TV shows that I watched as a child, or watching the Apollo missions from the living room.

Well, I spent a considerable amount of time reading, and studying about the nessesary equipment to 'work' the 'birds'. I thought that I would never get on the air! The 'books' told you that you needed a steerable array (gosh, that sounds expensive).... two rotors to not only point in the proper azimuth, but also an elevation rotor to point the antennas in the proper place in the sky! Of course, one also needed antenna's to point, and then the radio gear... SSB or CW transmitter on 145MHz plus a 29MHz receiver....

To shorten this story, and get to the point. I was comming to the conclusion that I would probably never get 'on-the-air' as far as OSCAR was concerned.... all that complicated stuff, and all...

... one day, I was tuning through 10 meters around the high end of the band... the whole band had been very dead... I don't know what I was looking for... then all of a sudden, I heard all kinds of signals.... everyone I heard was working other stations!!! And I could hear them ALL!! At first I couldn't understand what had happened. The band had been dead. Maybe I have an intermittant connection from my antenna, and that is why the signals just seemed to 'pop' in out of nowhere.... I finally realized that I was hearing the output of one of the OSCAR satelites (hearing people calling CQ OSCAR, CQ OSCAR probably gave me the hint!!). I sat there, longing to be on-the-air with them!

At first, I thought that I would just sit there and listen, If I only had a transmitter.... even a simple 145MHz CW transmitter would be great!!! Just then, someone started using one of the local 2 meter FM repeaters, I reached for the knob on the FM radio to turn it OFF... Then (EEK, I get strange thoughts sometimes (no comments from Doug!).... My FM rig can transmit in the proper frequency range!!! Of course the OSCAR 'birds' don't like FM being transmitted through (I have been studying, so I knew this)... BUT, I could get a scrap of wire.... disconnect the microphone... and use the PTT (push to talk) line to key the transmitter and have a CW signal on the air!!!

I set the transmitter to a frequency that I thought should be near the middle of the input of the satelite... and started calling CQ by shorting that wire across the mic-plug of the FM rig.... then I heard it!!! My own signal heard through the satelite... I didn't care if anyone heard me, I heard my own signal.... Of course it took me a little tuning to find it... but there it was. I wonder if I can send a QSL card to myself??? with them...
Just then, someone answered me!!! We had a great (short) contact, and I explained what I was using.... a 10 Watt 2 Meter (145MHz) transmitter into a 1/4 wave ground plane antenna... my receiver was an *old* Heath tube (HW-100 I think) job, and it was connected to a 10 meter dipole. I did receive a QSL card from the other Ham... It is one of my favorites!!!

Sorry for the long story... I had fun remembering it (that was back somewhere around 1978 or so).... The moral of the story....

Have FUN with Amateur Radio.... Fun like this is stimulating and doesn't have to be expensive... It also prepares us for the emergency and public service that we perform from time to time.

> PS: Still think I got the remainder of the 2mtr quad somewhere !!

Great!! that was a lot of fun too (another story), I was almost thinking of building another one!

By the way... how are we going to answer the question about who elmered whom?

Rich (NM1D) -- And PROUD of it!!!!

Here is the method I have used with success. Drill a hole just big enough for the pilot bolt of a chassis punch, and then use the punch for the final hole of the correct size. That will make a very nice smooth hole with no paint chipping, etc. If possible with the antenna, mount a ball mount on the car instead of the antenna directly. That will allow you to easily change from one antenna to another as you wish later. Be sure to use a stainless steel ball mount, as the other el cheapo balls will chip, rust and permanently corrode onto your antenna.

The antenna or ball will generally have a rubber gasket where it meets the car, for waterproofing. I make doubly sure of the seal by coating the gasket with clear silicon sealant before final assembly to the car.

To get a good ground conection, use an electric drill (or something like a small Moto-tool) with a wire brush or small grinding bit, to clean off the Inside of the sheet metal down to shininess. The antenna or ball will have hardware that tightens up onto that bare spot and makes good contact. Then paint the entire area inside the car with 2 coats of Rustoleum rusty metal primer, to prevent future corrosion.

If you are mounting the antenna on the roof (the best place for maximum coverage), a good way is to take the dome light out and then work thru that area of the roof. Then put the dome light back in when the antenna is finished. That often avoids having to deal with the upholstery.

Gary (N9KAW)

I have an Astron (and schematic) at home too. So this *is* a guess. I suspect that you could easily have generated some pretty big local fields with the tuner and the longwire. The impedance of the longwire could certainly have been high and that probably made for lots of RF voltage in the shack. Whether this was coupled into the Astron via the DC output leads, the power line or directly radiated into the box I don't know but it probably was one of those. The source impedance of the supply at RF is not guaranteed to be low (thus the extra bypasses?).

I don't know what the failure mechanism was exactly but I think it is a series pass supply which means that the output might be pulled above the desired regulated voltage. I suppose there is an overvoltage circuit which could have turned on. I'm not clear on what the precise failure sequence was but maybe there is a crowbar that got turned on and the supply tried to source current into it and broke something. With the RF present in regulator, over-voltage and over-current circuits it seems like almost anything could have happened.

I hope it didn't over voltage your radio. I fried a 432 transverter that way one time and I know of others who have lost HTs to the same fate. Good power supplies are *not* trivial.

I've been waiting for Tom Clark or Courtney Duncan to verify the schedule, but since they haven't, I'll leap into the breach.

Yes, the times should still be fine. (The METs, that is; as Vince noted, the actual times may shift slightly depending on actual launch time.)

And yes, the "demos" are still very much on. I don't know why they're called demos; to the kids who will be talking to the shuttle, they're very real!

To   : All Amateur Radio Operators
From   : Glenn Baxter, K1MAN via Bob Salow, WA1IDA

Radio Australia will broadcast personal voice messages into Kuwait. These messages can be recorded directly by telephone into Radio Australia or by calling Glenn Baxter in Maine. The latter path may suffer voice quality because of retransmission.

Only first names should be used for the addressee and the signature. No street or city addresses should be used.

The telephone number for Radio Australia is: 011 613 881 2222.

The telephone number for Glenn Baxter is: (207) 495-2215.

The Radio Australia broadcasts may be heard between 1300 and 1500 UTC each day. The frequencies used will be: 6060, 7205, and 9580 kHz.

Regarding the following comment David made in his original note...

One notable exception...to get the 28a/h to xmit out of band, you just cut
D21...no matrix programming change required. It's a different design, and
it's easy to see what's happening in the schematic. Oh...and there are two
D21's in the 28a/h...get the right one...the wrong one is in the backup
battery circuit and clearly has nothing to do with the transmitter portion.

QUESTION... Is the IC228H the same as the 28H in this respect??????????

As I mentioned when Die Harder came out, all the radios used there were
ham radios, too. I suppose it doesn't matter that the guard on his
IC-u4AT was talking to the army on their kenwood 950. Commercial
transmitters are big and ugly and have very few knobs, and even fewer
LED's and readouts.

WZ2B

P.S. Could the "ham plates in CA" discussion please make use of the
"distribution" line? I always encourage the use of limited distribution
where applicable - every once in a while, people forget this.

Subj: Pirate TV

I've seen DAK's advertisement for the wireless TV system. The posting brings to mind another *distinct* possibility. Ponder this ad:

GET ON THE AIR WITH OUR NEW COMMUNICATION SYSTEM

The Federal Communications Comission recently lowered the rerquirements for obtaining a license to use the Amateur Radio frequencies. The ability to copy Morse code, which has been a major barrier to obtaining a Ham license, is no longer required by the FCC. In a celebration of this momentous event, we at Starcracker Radio are offering this blockbuster special so you can be the first on your block to get in on fun of being a Ham. Starcracker-1 transceiver, 50 watt transmitter works on all Ham bands from 14 MHz through 30 MHz. Only $79.95. Starcracker 1A same as the Starcracker 1, but works on Ham bands from 30MHz through 150 MHz only $109.95.

Why be power-limited? Why skulk around on 11 meters wondering if you'll be caught running illegal power? Our new StarCrusher-100 will give you 100 watts of power that you can LEGALLY use to talk nearly anywhere in the world! Only 139.95. Or, for more talk-power you can key up our StarCrusher 500 to blast through the QRM. This fantastic radio is on sale now for ONLY 199.95. But don't wait! Act now while supplies last!

Best of all, ALL our radios come with an easy-to-use exam outline. All the questions you'll see on any license exam will be right there for you to study, and the CORRECT ANSWERS are right there with the questions. You'll also receive easy-to-follow instructions on how to find examining stations and what you need to do to get your license. DON'T WAIT! DO IT TODAY!

73,
Dube   N5PDK

In <91@thoreau.nsc.com> rtodd@thoreau.nsc.com (Ron Todd) asks:

> Are there any states which will not issue for "out of state" calls?

No problem in Texas... I've had my 8-land call on my call plates for about 7 years. Cheap, too.

Gee, instead of being MORE EXPENSIVE since they are associated with PUBLIC SERVICE, ham call plates ought to be CHEAPER!   :-)

73, Y'all!

> ...challenge to say something *good* about our hobby.

Last Sunday evening I backpacked into the Boulderfield, 12800', north of Longs Peak, Colorado, 14255', as the Park Service was evacuating an injured climber from the north face. They were unable to reach a flat enough area by dark for helicopter evacuation. The chopper made one pass and bugged out due to erratic winds. It was 9pm, eight hours since the accident, six miles and 3400' down to the trailhead, and the guy was still bleeding slowly but uncontrollably from a compound fracture.

I offered assistance with my 2m HT. The EMT in charge decided he needed to converse directly with a doctor. That was hard to arrange with the Park Service HTs. I made a phone patch with 1/2 watt via line-of-sight to a repeater in Fort Collins, 35 miles away and 7800' lower, thence called back into the Estes Park Medical Center about ten miles away from us. The EMT and the doctor had a productive conversation.

Due to unpredictable winds, the rescue team elected to carry out the victim that night. At 6am the next morning he reached an ambulance at the trailhead, about 17 hours after the accident, and was in surgery in Loveland about three hours later. The next day he was doing fine (I visited him briefly); recovering from blood loss and beginning the difficult road to recovering the use of his right leg.

Oh yeah, during that same two day backpacking trip I also helped two parties call in to report they would be late getting off the (notoriously long) trail, helped someone say Hi to their grandmother in Denver, called the Colorado Mountain Club peak register coordinator a couple of times to pass information about register conditions, and kept in touch regarding my ex-wife's sudden overnight stay in the hospital. (We have a seven year old daughter...)

How'd I ever go into the backcountry without a radio?

This is a perpetual problem. The trouble is, the guy with the problem is the only one who *never* knows about it because he is transmitting--everyone *else* has to listen to it.

To further complicate matters, many radios have both a microphone gain and a deviation limiter adjustment.

The microphone gain generally sets the gain of the microphone amp stage, which in many cases nowadays is a monolithic chip containing an op amp or two. The mic gain determines how much audio will be shoveled at the deviation limiter circuit. Set this too high and you will be limiting the road noise to same level as your voice at screaming volume = no good! This should be set so that you just barely limit the louder peaks when speaking in a normal communications level voice. Watch out for the touch tone level; the IC-2 has a separate adjustment for the tones while some radios do not. You may have to monkey around a little to get the tones and voice balanced on such radios.

The deviation limiter attempts to prevent splatter by limiting the modulation index. It generally performs minor audio shaping and limits the amount of drive to the modulator circuit. This adjustment keeps your signal roughly within the +-5KC bandpass of most receivers.

Note carefully: you can set your mic gain all the way up and your deviation limiter to near bottom and end up with a horribly distorted audio signal which is barely audible; you can also set the mic gain very low and crank the deviation limiter way up so that in order to be heard, your signal will splatter out of the bandpass of the receiver.

The best thing to do, again, is to adjust the mic gain for a wee bit of limiting at normal communications speech, then set the deviation limiter on a calibrated monitor to the 5KC range; this will give you a punchy audio signal and give the rest of your listeners's ears a break!

Thanx in advance.

Packet radio in the CB (11 meters) isn't a new idea, I played with the idea a bit with a friend.

Things to think about: Time limits (if you want to operate legally)

Problems: NOISE....(Donno what the hell it is, so lets key on it!)

Besides, most CBers lack the intelligence to run a radio AND terminal.

(Sometimes it seems like running the radio is hard enough for them, with the 3 hour long conversations about VSWR and grounding...)

While I have no first hand experience, I have been told by several folks that they've seen poorly constructed Astron supplies. One fellow found the AC line wired backwards while yet another found an area that missed solder completely!

Is it possible that maybe you've got a marginal connection in the supply?

DISCLAIMER: I'm NOT badmouthing Astron. I'm just relaying comments I've heard in the last few weeks regarding their assembly.

Just to add a note of levity: I have a mag mount 5/8s 2-meter whip on top of my pickup truck. I drilled a hole in the roof, though, so that I wouldn't have to feed the coax through a window.

Q: Why did I go this way?

A: Lots of reasons -

1. I can move the antenna to another vechicle easily (and only leave a few scratches :-)

2. I can run it on the roof of my house (sheet metal roof)

3. Truck roofs are *tall*. I am sure that the 6'6" clearances in mall parking lots & c. would scrape off a hard-mounted antenna. The mag mount just tips over.

4. The measured SWR is 1.1 to 1 or better, so I can't get too excited (pun) about efficiency arguements

5. I don't have to listen to the wind noise created by always having a window cracked open.

I just picked up a disc-cone for the house, though, so #2 isn't as much an issue now as it once was.

Brian,
  Three commercial solutions come to mind. Microwave Modules still has
a 2M <-> 1296 transverter as far as I know. Probably fairly pricey.
The same is true for SSB Electronics (DM1200 or so I think for 10Watts).
A less expensive alternative is the Maki-Denki (sp) Japanese solution.
It runs about .75 watts output and the one I had showed 2-3 dB NF on
receive. I bought it for about  $125 in Tokyo as I remember 4-5 years
ago. 100 mW drive is fine (too much?).
  All the above are linear transverters and are usable (although probably
none is rock-solid stable) for SSB/CW as well.

  10-20 Watt linear amplifier modules are available from (at least)
RF Parts in San Marcos, CA for under $70. A lower power driver is
also made by Mitsubishi which will put out the 1 watt or so needed
to drive the power amp. These low power drivers need only about 1 mW
drive and I think can actually do about 4 watts saturated so they
make pretty good modules in their own right. I think they are about $40
or so.
  If you get into building your own transverter, you might refer to my
microwave station design series in Ham Radio Magazine for a fully
phaselocked LO system. Sounds like the commercial route is likely more
to your liking at this time though. See if you can get someone in Japan
to get a Maki-Denki for you. The latest JRRL CQ Ham Radio has the
UTV1200 in it (I think that is the correct series, I don't read Japanese
I just look at the pictures (:>)  )  from Yen39,000 to Yen49,000. Looks
like one of these is 3.5 watts output. I'm reading from page 201 of the
September issue in case you can get a copy to someone who can read it for
you. There are probably some other ads for it elsewhere in the issue.

My definition of a ham techie is someone who is more interested in the
techincal side of radio than in operating. In general, a techie is a
builder not a DXer. A techie likes novel circuits or software not
making the BPL. A techie operates primarily to try out his/her new
ideas or to talk about them. A techie will rarely be found hanging
around the "good ole boy" roundtables.

An ultra-techie is so far gone he/she won't even talk to the techies. :-)

To become a techie you only need a burning desire to learn and do.

Regarding Drilling holes in your car:

Don't use a PL-259 (SO-259) on your car. Go buy a Larson (or your favorite manufacturer) antenna base and the mating antenna of your choice. There is a complete set of instructions included with the unit. As another poster suggested drill a pilot hole first and then

USE A CHASSIS PUNCH to make the appropriate size hole. This will make a clean ROUND hole of the correct size.

The Larson mount has a square steel inside piece with the corners turned up. This will spring a small amount and scrape its own contact to the bare metal (this on the inside of the car). For the outside there is a moulded, threaded cap with an O-ring seal to fasten to the inside piece. The result is a neat water tight antenna mount that you can buy different kinds of antennas to fit (like when you buy a dual bander and think you need a new antenna). For my own installation I use a 1/4 wave 2m antenna for normal commute use. When about to go on a trip I swap the 1/4 wave 2m ant for a 5/8 wave 2m ant to get better range.

For the faint of heart, look in the Yellow Pages under mobile radio. Find a local dealer and have them take down the head-liner, drill the hole and dress the coax cable. Check with them first, their antenna product line may not include what you need, you may be better off buying the antenna first and having them install your antenna. Last time I made the inquiry the price was less than $50 and it included the antenna and coax.

Regards, Dave

Does anyone know if there is an Amateur Radio Club in the Brookline, Massachusetts area. I presently live in Brookline, and am going to be taking my novice test very soon. I'd like to know if there are any other Hams in my area? I am part of the Northeastern University Radio club in Boston, Mass. Just wondering if there was anything going on in my hometown.

Thanks.

1* <- to be filled in soon!

B&W and color transmissions use the same frame rate 59.94hz. In the beginning, B&W was transmitted with a 60hz frame rate, but since the advent of color, the broadcast standard (RS-170A) sets the frame rate for all transmissions to the color rate of 59.94hz. The color subcarrier and the color burst are deleted during B&W programming to prevent false color on misadjusted receivers.

The frequency/phase of broadcast images can change from source to source although most modern plants lock all their sources together to allow supers and special effects. Unfortunately, very few stations use high stability references for their plants. In the past the networks used Rubidium frequency standards for their feeds and some stations installed these "atomic clocks" locally so they could stay in phase with network programming. This allowed them to super their call letters over network programming. Today however, with the advent of cheap digital framesyncs, the stations run off their primary reference all the time and resync incoming feeds to their house reference with the framesync. This means that the stability of the signal is reduced to that of a simple crystal oscillator, often not even temperature controlled. The use of cheap digital equipment has allowed the frequency tolerance of reference systems to be relaxed so much that the FCC no longer even requires that we monitor our reference frequency.

This is not the worst problem with your scheme however. The problem is that stations are not in frequency/phase with each other. What you would be measuring would be the short term drift between two or more totally unrelated crystal oscillators. If all the stations in a local area could be PAID to keep their plants referenced to a common reference, then you would have something.

FLAME WARNING !!!

When I am misquoted or misinterpreted, I take the privilege to FLAME !!!

> No, I'm sorry, it's stupid and not well thought out. It was stupid and not well
> thought out when Phil Howard proposed the same thing last year. Who the hell
> are you to tell me that I need a note from some overbearing old fart that says
> I'm *allowed* to have a radio because I'm being supervised? Beyond that, what

I did ***NOT*** propose the same thing last year. I suspect you did not really read exactly what I said and the context it was applied to, because I received a couple of private replies from people who misinterpreted it like you are doing.

THE CONTEXT WAS: there was a proposal to have the FCC restrict transmitter sales. This resulted in many threads of argument.

WHAT I PROPOSED: was one of several alternative plans, including adding that *IF* there must be such a law, there SHOULD BE A CLAUSE to allow the scheme of having the elmer or some other ham sign for candidates.

There was also an alternative that I suggested of asking the dealers for voluntary enforcement. The flames I got back from that were **COLD** because the "flamers" assumed I was proposing the idea from the context of where we are now when in fact I was proposing it as an alternative to a bad idea. They assumed, as perhaps you also did, that I was coming up with that idea because I wanted to see it done when in fact it was to cool down the ideas of having the laws that were proposed.

It ABSOLUTELY DOES **NOT** mean that I like the idea. Some people have an attitude problem when it comes to ISSUES: they are UNABLE to deal with things in forms similar to: "I don't like X, but if we have to have X, we also need to have Y". The no-code issue falls into this. But far too many just said they were against it (many without any logic or reason) and failed to put in their position when it came to figuring out what a "no-code" really was.

If fully support the right for people to OWN:
    GUNS without a license
    CARS without a license
    FISHING RODS without a license
    TRANSMITTERS without a license
    ANY CHEMICAL OR DRUG without a license
and for anyone to make or manufacture for themselves any of the above.

> I know you're trying to come up with a solution to something you percieve to be a problem. I don't believe it is as big a problem as people who like to worry about it wish it were. In the only instances above where you cited licenses that are supposedly proof of ability to operate (cars and airplanes), there is no precedent for making a license required to buy the item whose operation is restricted. It is illegal to operate a ham transmitter without a license. The FCC *is* prosecuting cases where unlicensed operation takes place. There is no need for a "fix" that will open up a whole rat's nest of liability problems and make it even harder for new hams to join up.

Now if you had posted some of these issues back then, it might have been made clearer now. I just don't like being taken out of context.

If we need to require a license for anything, it should a license to reply to something you misinterpret (just joking, I support your right to post whatever you want, but I will rebut if it is wrong).

Things, they are a changin', Frank. The WGA is now very involved with users, as in, "our future lies in those pockets." This years convention in Long Beach will include a large emphasis on users. True, it once was a "manufacturer's group", but those days are gone.

To all those who asked about the WGA months ago, I haven't forgotten you. I just got back from 2 months research in Arizona and am catching up on mail. You'll get the info requested "real soon now" (quote taken from ACC sales people when asked the status of their repeater controller software updates!).

PC Electronics has a right to do this if they want. It does not influence my decision to buy or not buy anything from them. I currently do not because what they sell isn't the kind of equipment I want to buy.

> -Incidently, there is no reason an
> -orginization with a business license can't buy ham gear and have it
> -modified to use on their assigned frequencies, and use it.
>
> I'm not sure, but do radios have to be type accepted for business use?

The FCC requires (as far as I know) ALL business uses of radio to be LICENSED and make use of equipment that is TYPE ACCEPTED for that particular service. The key words are "make use of". The FCC (apparently) has no authority over what is actually owned, and has only limited precedent for equipment sales (e.g. CB linear restrictions).

People who modify their transmitters for "out of band" that covers the land mobile services have not broken any laws I've ever read. But to USE them on those services, even though they are properly authorized (e.g. a police officer who is a ham, and is using his modified ham HT on his authorized police radio frequency) is a violation of the use of type-acceptance rule.

Back in the 70's, K7SS and K7RA had a program on KRAB-FM (107.7 MHz, founded
by the infamous Lorenzo Milam of "Sex in Broadcasting" fame) in Seattle called
the "Ham Radio Hours". Actually, it had little to do with amateur radio, other
than the show was amateurish and the hosts were hams...

They did a lot of wild stuff, and a couple of times they announced that
"the MUF is up", called QRZ, and turned off the carrier while they "tuned
the band."

Reading about problems with out-of-state call plates, here in Massachusetts
they don't care and I was issued (showing a copy of the Alien Reciprocal
License) a very nice plate with my call EA2SN. Shame the car died two
days later and I had no money to replace it! But my dream to have a car
with ham plates was fulfilled (in Europe we don't have such things)

What you want to use is the NTSC subcarrier (3.579545) from a network
live television broadcast. These are transmitted with Cesium clock
accuracy. Furthermore, phase detection at 84 meter wavelength is
easier to make accurate than at 5,000,000 meters (60 Hz) or
15,800 meters.

However, for most of the US, this is really not the way to go at all.
LORAN C will give you accuracies of a few hundred feet, with differential
accuracies much better than that. You can buy
a LORAN C receiver with RS-232 interface for about $300.00.
Currently, some parts of the US are in bad geometry zones, but this
is being corrected. Phoenix is one such area, but in 1-2 years, we
will have good LORAN C coverage here. If you couple LORAN C to
a digitized road map, you should be able to keep continuous track
of where you are. The FAA (worlds most conservative regulator agency)
is starting to allow LORAN C ILS approaches - this gives you a clue as to
how good it is.

By the way, LORAN C transmits on 100 KHz and is easily detected with
a resonant loop-stick and FET impedance converter. Build one and you
can see the pulse groups with a scope. Pretty neat stuff!

The latest extra call I have heard about here in Maryland is WE3W. There were a lot of people holding off until the W 2x1 calls came out and they are going very quickly.

And, yes, that does mean that someone out there is WA3 Dog and is Dog/4 when the are mobile in Virginia. I haven't heard that call around yet.

But, here I sit, still waiting for a buy your callsign plan, stuck with a humongous (sp?) call even though I've been an extra for 10 years.

>Things to think about: Time limits (if you want to operate legally)

What time limits?? I don't see how anything can be considered illegal if you use an un-modified CB rig. You are still just running AM/SSB and the sound of packet is no more illegal than all the wolf-whistles and other noises Cbers like to make.

>
>Problems: NOISE....(Donno what the hell it is, so lets key on it!)
>
>Besides, most CBers lack the intelligence to run a radio AND terminal.
>
>(Sometimes it seems like running the radio is hard enough for them, with
>the 3 hour long conversations about VSWR and grounding...)

I sent a private communication to someone about this subject and my rationale for even suggesting it. I suppose being as I made the statement in public, my clarification should probably be public as well, so her goes.

Actually, I thought it might even clean up CB after a while.
Just think. Joe CBer hears this noise (brapppp) which he considers annoying, so in the true spirit of CB, he tries to jam it by keying up his rig and shouting obscenities into the mike.
Of course when he un-keys, he again hears brappppp. Eventually the packet traffic gets thru cause it just keeps right on trying and because packet users don't usually sit there with the speaker on, they never even hear Joe CBer. But Joe CBer has to continue to listen to brapppp brapppp brappp. How long before Joe CBer gets fed up with the whole thing and puts his CB in the attic where it belongs??

The end result being, we might finally have a license free band (remember Don Stoner's proposal) for all the computer geeks who want to link conmputers and send traffic that is no legal over HAM Radio (like USENET). Add to that the cleaning up of CB and it sounds like a pretty worthwhile idea (IMHO).

SuperMorse 3.x (I think version 3.09 is on SimTel20, I have 3.15 from
Compu$erve, and have not checked lately for updates) is a fine program
by Lee Murrah, WD5CID.

It has been able to send code from a file ever since version 2.xx and
before that it was called "CW" it still sent from a file.

Rich Bono, N1MD, who reads this newsgroup, has a good one called AUTOCW, which
I think also will read from a file.

It ain't hard in the DOS world to read a file, and any code program that
-DOESN'T- just isn't finished yet! :-)

However, most loran-c receivers use voltage-probe antennas, and are
quite susceptible to man-made interference, such as arcing neon signs,
fluorescent lights, electric fences, and unshielded ignition systems.
The one I run in my car often fails to lock up with a verified
position. A magnetic-field antenna (big ferrite rod) would eliminate
most of those problems, hence my question a few weeks back on this
group as to where to find big ferrite rods.

One interesting thing you'll find if you start having an accurate nav
instrument in your car: a lot of the roads aren't exactly where the
maps show them to be. Some are off by a tenth of a mile or more out in
the middle of nowhere. (I can't help but wonder if that's just plain
simple error or whether the Defense Highway System isn't where the maps
show it to be in order to make bombing it harder!)

I opted for drilling the hole, because I heard that mag mounts are prone
to vibration and can scratch the paint, causing more damage than
drilling a hole. If you want to sell the car, you can buy a little
rubber plug. If you are drilling a BMW or a Porsche, then you obviously
make enough money not to worry about such matters.

I need information on Bendix King handy-talkies, I know the basic programming
of them, and some modes, but not as much as I need to know.

It's a govt bander, but in theory, it'll work in 2m as well, and I know it will operate at least as high as 170Mhz, and low as 155Mhz, and will store (but not always accept/operate with) values as low as 101Mhz.

What I need is a information on "secondary programming mode" and I need to know the meanings of options 1 - 12345 and 2 - 12345, as well as involk dtmf mode (Little Phone Reciver on display).

Why: A friend of mine is a Chief in a Vol. Fire Department in Minn., and they got 4 of these with chargers, and no paper from another city in the midwest. They have no cellular service, but do have 2m repeaters/ phone patches, and has to carry this radio whenever he's on standby, the radios have 14 channels, but his area only uses 8 for everything, including fire, law enforcement, etc... He's a ham, but doesn't own a HT of his own. So right now, the only extra feature he's added is NOAA weather (with scan bypassing, for good reason).

I have no model number....

...Don't ask, that's about all the info I have, just spent some time on the phone explaining how to trip prog mode, and some basic programming features (all I know about the bendix king). So I figured SOMEONE out there knows...

Yes... grounding is VERY important... glad it helped (the artical)

>
> Can you point me to any literature on LORAN? I'd like to learn more

Hmm... Well, you can try the US Coast Guard... They have a group based in Wildwood (NJ or NY, I can't remember which) that does a lot with LORAN. Or you can contact the "Wild Goose Association".... Or (I don't know how helpful they will be) contact Megapulse, Inc., (Bedford, MA) 617-275-2010.... They make the SOLID STATE MEGAWATT (yes that is MEGA not milli or kilo) LORAN transmitters... and have been very dedicated to LORAN. Although, they are an engineering group... I don't know if they will be able to help you at all....

Getting your recevier to give positional information with only two receivers is fairly complicated.. and the capability must be built into the tracking software of the receiver.... Some advanced receivers have this ability, I think they call is "Rho-Rho" tracking, or some such thing... (Sorry, it has been a few years since I worked there.... and I didn't work in the areas of tracking software.

By the way... it is amazing how many Hams still think that LORAN is still wiping out the 160 meter band.... This is similar the notion that the Amateur Radio Service has lost the WHOLE 220 MHz band to the 'commercial UPS boys'.... (I heard that one on a repeater this morning)... Geesh guys, WAKE UP!!! LORAN has been on 100 KHz (oops, don't want to get flamed, make that kHz) for years now (and the old LORAN A that caused trouble on 160 has been OFF THE AIR FOR YEARS)... and (if we lose) we will only lose the 220-222 MHz segment of the 220-225 MHz Amateur band (for those who can't do the math... that leaves 222-225 MHz (3 MHz) for Amateur Radio use).
[sorry for the rambling again.... I havn't had my coffee yet :-)]

This used to be true John. The networks quit doing this some time ago. Our NBC network feeds are hot switched via satellite from one location to another by uplink command from Skypath. None of the feeds are referenced to each other. There is a Frame Syncronizer as part of the NBC downlink package at each station. The incoming net feeds are resynced to the station's house sync generator by this frame sync. The house sync generator in most stations uses a simple non-temperature compensated crystal oscillator. It is not unusual to see a 10hz variation in subcarrier frequency from feed to feed and from station to station in a market these days.

Yes, Patty, you certainly don't always need the best possible signal. Listening to any repeater in any large town will reveal a large number of people who have taken that philosophy to heart, and seem to revel in the less-than-best signal they put out. You regularly hear people who are noisy into the repeater and yet seem to have no trouble hearing it.

Most repeaters are designed to have roughly reciprocal coverage with a 10 to 25 watt mobile and a properly-installed car antenna. In many cases, back when I was doing that sort of thing for a living, I'd find that the antennas were installed with high SWR, bad grounds, and similar problems. These all caused the transmitter to back down its power to protect the final stages - some of the people with 25 watt radios were in actuality putting about two watts into their antenna!

Really, it only takes a few minutes to install an antenna properly. I have a great deal of trouble understanding why someone would spend $400 on a radio, another $50 on an antenna, and then wimp out at the last minute and not install it properly! Probably didn't drill holes in the dashboard either.

The cynic in me insists this is just one more aspect of the great american lack of drive for excellence. The technician in me says it's more likely that they're afraid to. After all, how many american hams have adjusted the mic gain and/or deviation on their radios?

I wonder what percentage of Japanese hams have drilled holes in their cars to permanently install antennas? It would be an interesting statistic! (Yes, I know, many fewer cars in Japan. %!)

(Note: nearly all rice-rockets come with the microphone gain set 'way too high for mobile use. Just listen to the local repeater - if you can hear road noise and the dude's window is up, he's got too much gain. But most hams don't realize that. Classic conversation: on hearing the NEIGHBOR's dog barking in the background of a ham transmitting from home, I advised him to turn down his mic gain. He apologized for crowding the microphone and backed off, whereupon the dog's voice overpowered his. And this guy is a police dispatcher - a "skilled professional radio operator" with an Advanced class license. Arrghhh!)
     - Brian

Sorry to post this to the net, but unable to reach alux4!jvm@ucbvax.Berkeley.edu. Thanks for the offer, Jim, but I received the information on the HD-15 from another source. Thx for the transistor info, also.

You can always just read ALL the groups, and you'd have what you have now. You are someone who, like me, really won't benefit from the change. I for one expect to read ALL the groups as I do now. But there are definitely others who DON'T like skipping over all the articles.

```

1. Since when was there a "forsale" group? I've never see this one added. The discussion that created .swap considered that named and chose this one instead.

2. Why the cryptic name for the discussion group? And how to you DEFINE what constitutes a "discussion"?

3. It has been proposed the have rec.radio.swap instead of rec.radio.ham.swap so what is your reason for not having that?

SAREX TIMES
Below is a tentative schedule for Amateur Radio Operations from Shuttle mission STS-35. Since the schedule is based on Mission Elapsed Time, this schedule will be updated and reposted soon after launch to show the "real" UTC times and dates. This tentative schedule assumes a launch time of 1 Sep 05:17 UTC. Data for this schedule comes from W3IWI's May 27, 1990 SAREX.009 AMSAT bulletin updated with the new robot operating schedule that appeared in AMSAT News Service Bulletin 237.04 August 25, 1990. I can not speak to the authenticity or correctness of this schedule (I'm just a number cruncher!). For example, is the Demo schedule still accurate? Or will there even be Demo operations during the mission? The "Demo" times are from the May 27, 1990 schedule and have probably changed by now. Anyone have any more accurate and timely information? Please EMail any corrections or information you may have.
73 and happy Shuttle DX'ing.

In article <15911@oolong.la.locus.com> dana@lando.la.locus.com (Dana H. Myers) writes:

} Recently there has been a flurry of discussion regarding the new
}movie 'Pump Up The Volume'. The story appears to be something about
}some high school students putting together a bootleg broadcast
}station. It just so happens they use an amateur transmitter to
}do this. Some folks here feel this is a problem, that it may/will

}either case, the fact a movie has ficticiously shown a ham transmitter
}in use at a bootleg station probably won't do much to stimulate the
}mis-application of ham gear.

For the last time NO! This movie does not show a ham transmitter, or anything that resembles a ham transmitter in use at a bootleg radio station.

I've seen the movie--the transmitter involved looks more like an HP signal generator than a ham transceiver. Amateur radio or the word "Ham" are never, repeat, never mentioned in the movie. Enough said...

Could some kind soul please email me an explaination about this combination of HAM and BBS stuff? I was just leafing through a Heathkit catalog and saw equipment that seemed to be used for this, but I am a little confused. Okay, *very* confused. I am a BBS type and know nothing about HAM. If it works the way I'm suspecting, I have a bad feeling that I am going to be spending a lot of money in the next few years :-)

>are noisy into the repeater and yet seem to have no trouble hearing it.

Yes, I certainly have! But I'll bet they're virtually all using rubber duckies. Unless you're blocked by a mountain or some such, even a 1/4-wave mag mount can give a solid signal in most instances. Of the 3-4 repeaters I use occasionally, I only need the 5/8-wave whip to get cleanly into one (about 40 miles away). (This is with a 2-watt HT.)

The point is that if the 1/4-wave doesn't give satisfactory results, switch to a 5/8 or a drilled mount or both. But if it works and the car owner prefers it, why not stick to the simpler and less damaging solution?

>(Note: nearly all rice-rockets come with the microphone gain set 'way
>too high for mobile use. Just listen to the local repeater - if you can
>hear road noise and the dude's window is up, he's got too much gain.
>But most hams don't realize that.

Amen to that. I've especially noticed that in the past few years. I'm not sure what you mean by "rice-rockets"[sic], but it seems like the newer HTs tend to have a really high mike gain. My older one (ICOM 2AT) isn't like that, but my Kenwood TH-21 is a little hotter, and I've heard others that are really a problem.

Patty

The question about light dimmer RFI has appeared on the net. I remember seeing some time ago, at Channel's (a home supply store), a variety of light

dimmers. One was the El-Cheapo. Another model claimed to have RFI suppression built in. Didn't try it, so I don't know how good it is. Probably just lets you hear local AM mw stations.
If your neighbor in the condo uses the El-Cheapo, you're probably out of luck.

> > A friend of mine would like to change the speed up a clock by a factor
> > of 2.0 or 0.5 for a psychology experiment.

I once did something like this for a model railroad fast clock (so the model railroaders could run the toy trains on a schedule, playing dispatcher). What I did was use a clock chip that can be set by pushing a button to make it step thru the time at 60x real time. (not the "set the hours separately from the minutes style"). I wired the chip to be in this slow set mode, and then I fed it a low frequency to clock it. The low frequency came from a divider that divided 60Hz by 6 or 12. Or you could do some other factor if desired. Or build a low frequency osc.

There IS one advantage to call-plates as yet unmentioned here:
     parking tickets

What IS he talking about?

Ohio went to 3x3 plates (ie ABC-123 or later 123-ABC) plates several years ago. When they did, gas-jocks and jills starting giving such a hard time on credit card purchases that I would say without prompting:
     WB8FOZ, yes it is
before they said "That's not an Ohio tag"

But I ALSO found that when I got parking tickets, I NEVER got chased for non-payment. Since others caught at the same places did, I finally concluded that the keypunch clerk was as adept as the gas folks, and just deep-sixed those tickets with "bad" tags.

Life is rough, sometimes ;+}

Hi netlanders,
What is the status of the amatuers in Kuwait?  Is anyone on the air?
I had a call from a student at Oregon State Univ. who was wanting to see if
he could get any info about his family via amateur radio.  Does anyone
know? ( The student had heard that there was a amateur station in Oman that
could be telephoned requesting info.  If you then called back in 8 or
10 hours there may be info!  He hasn't tried it though).

Any info you can give will be appreciated.  Post it here for net wide
reading or send to me directly and I will repost a summary.
Thanks in advance.   73

I constantly see requests for various ham related software like NOS, NET, and many other programs. Here is where you can find all of the latest and greatest stuff, so have a blast...

+--+

HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the Amateur Community (but there is other stuff on-line). As of now I have not attempted to promote this system any place except in the amateur channels (PACKET, USENET, & word of mouth), and will continue under this policy, as I hope to keep it oriented toward amateur radio. The various software for UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through user support I hope to keep the latest and greatest ham software on-line. Below is the information that is needed in order to access the BBS via Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs
Number: (301)-625-0817 -- 1200 & 2400 (Non-MNP)
Number: (301)-625-9482 -- 1200 & 2400 (MNP5), 4800 & 9600 V.32 (V.42/MNP5)
Number: (301)-625-9663 -- 1200 & 2400 (MNP5), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 700 Meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.1[2,3,4])
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx, 10.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.08)
AA4RE BBS for the PC (Version 2.10)

Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

```
uucp wb3ffv!~/FILES /usr/spool/uucppublic
```

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

```

>Yeah, right.
>

You give the general public too much credit. If a kid sees a radio in a movie that is shown to be able to make him more popular, don't you think he'd like to get one? And do you think the average kid (or ham, for that matter) is smart enough to know how to modify it into the bcast bands? I think not. So if a kid gets his hands on an HT, say, why wouldn't it seem perfectly logical to him that it should work? (Lets see, it's an 'amateur' radio, like the movie said, and it says FM on the side, humm, that must mean I can receive it on my FM radio!!!) Same goes for am radios and HF rigs. Believe me, the general public believes what the movies tell them about radios and what they can (and can't) do. Take a look at Die Hard 2, and tell me that those Kenwood radios can do all of that magical stuff the bad guys say they can do. They also believe Alf can take to his alien friends on the HF rig in the garage. I've seen and stopped more idiots kids of this type that think they're cool for using (usually stolen) ham equipment to jam/kerchuck repeaters. (I've been into radio since I was in junior high. I've seen this with my own eyes). Whether you choose to believe it or not, this kind of look-alike copycat mindset exists, and has caused (and will continue to cause) problems on the ham bands.

>Its too early in the morning. I really shouldn't be doing this. But,
>I just can't stop myself.
>

You're right on this point. You shouldn't be doing this. Flames are in bad taste, and represent the ignorant mind trying to express itself forcefully. If you wish to have your opinion taken seriously, do it in a calm and intelligent manner, not like a child in a tantrum.

Jeremy, I agree with you 100% as long as its _positive_ publicity we get.
If parents start yelling 'So that's what those guys with the towers are doing.
Trying to brainwash our kids. Let's outlaw them!' I'd worry. I don't expect
to see this happening, but whenever parents have the slightest idea that their
kids may be in danger, the go non-linear. (And rightly so in some cases.)
I'm really glad you've got your license and are active in the hobby. You're
right - people your age do represent the future of the hobby, and I hope
that more folk like you get interested in the hobby. (whether they like CW
or not :-)) This movie is causing quite an uproar, and as you've probably
seen, I've gotten lots of flames from people who don't see things the same
way that I do. I'm glad to see that at least one young person has his head
on straight and respects the FCC rules and ham radio ethics. Good luck and

Subj: What's a Techie?

Discussions of new licensing plans have been replete with references to "techies" and "ultra-techies". Will someone please define these terms? Are we talking about people who can design and build superhets? Someone who knows how to string together computer equipment? Someone who can design a functional antenna system for 23CM? Who are these people and what are the qualifications for becoming one?
I might be a "closet techie" and not know it.

Thanks for a good article on LORAN; it helped to take away some of the "magic" aspect of the thing. I've got a fairly cheap handheld unit that I carry along in the backcountry just for the hell of it to see what it will do. Grounding it properly makes all the difference in the difference in the world between results and nothing at all!

Can you point me to any literature on LORAN? I'd like to learn more

about it. This receiver requires 3 signals to get a fix; is there
any way I can do it with just two? I'd appreciate info. Thanks!

Ken

>Bonus question for legal types: is CW a legal mode in the CB (11 meter)
>band?
>

Having listened to CB lately, it is my opinion that the FCC doesn't
really care what type of emissions are used.

I would hardly expect that CW would stand out from all the other
noises being generated at 11 meters.

Actually, I wish computer hobbyists would start running packet on
CB. Then maybe it will get some worthwhile use.

I saw the film Friday. It has nothing to do with ham radio, in fact, the words "ham radio" are never mentioned. The film is essentially a sociological study of boredom among teenagers in suburbia. It was a good movie until it decended into stereotype characters/situations towards the end.

It was not plausible technically, unless you can figure out how to alter a "shortwave set" to broadcast on 92.5 mHz.

Gareth--the CT program is specific to the CQ WW, ARRL DX, and WAE contests. And believe me, it's a pleasure to use in any of them. It can surely be used from anywhere in the world.

BUT it's not the kind of program one would want to modify. The quintessential, generic contest logging program has yet to be written, if it ever can be--and many of us are waiting for it. The biggest problem is that each contest has a different set of multipliers and that database has to be created and queried by the logging program. It would laborious to say the least to manually enter the multiplier database for, All Asia, SEANET, or some of the smaller DX contests, for example.

Again let me emphasize that the CT program is EXCELLENT, but it is limited to 3 contests at this time.

No it is not. Rules say you must transmit in plane english, and at 5 watts or less. But, FCC really doesn't care what you actually transmit, or how much power you use in that band. I know people who regularly send at 100 watts of power. It's most anoying since you can here them across 10 or more chanels.

Rather than design and debug my own, I'd like to find a source of kits or modules to convert between the 2m and 1296 MHz ham bands. The application is to build a repeater using an inexpensive 2m exciter and

receiver with the channel frequencies being in the 1282 (tx) and 1262
(rx) area.

I've got about 100 mw of 2m to upconvert; then I'll amplify it to the
proper output power. The receiver is 2m also, and quite sensitive.

This is FM, so a linear mode isn't necessary. The receiving converter
and transmitting converter would be best separate so I can operate them
simultaneously and shield them from each other.

Any suggestions as to suppliers, or experience with particular models
you've used?

Recommendations on a duplexer would also be appreciated.

Subject: Ham plates in CA
I have had my call on two cars at the same time. When I was in the
Air Force, I would keep one of my cars registered in CA (with ham plates)
and register the other in the state where I was stationed (ham plates also).
My legal home has always been CA so that is legal. Made it easy to remember

A friend tried to register his car where he was stationed but without bothering
to find out the rules for ham plates. He tried to do it as a vanity plate,
and was not permitte since it was a reserved (for hams). His call was from
a completely different area so it was surprizing they cought it.

I have a Kenwood TM-321A that I have been using for packet. It runs 24 hours a day. Recently the center segment of the S-meter disappeared. A few days later the light on the right side of the display disappeared, and now the left side has gone out leaving the display dark. Is anyone familiar with the innards of this rig? If so do you know if the display unit is a replaceable part, and does it come with lighting?

Thanks.

And there was the time in 1976 when we were all going through the gas crunch and I had the California plates "WA6IRH". In California, at least, we had the "even-odd" system for filling up your gas tank - even numbered plates got to fill up on even days, and odd on the odd. If there were no numbers in your plate the plate was considered to be "odd" (in more ways that one, it would seem). So, since the "6" (number six) looked like a letter G to most all station attendants, I could get a fillup on either day through persuasion.

I agree... even though I probably won't be able to get on the birds for
some time to come, I went ahead and joined. After all, I want there to
be satellites up and working by the time I get to use them!

Thanks for all the replies I've had to my query. I had a hard time
choosing the tracking software, but InstantTrack won out (I'll probably
end up getting QuickTrack for the Clemson ARC).

I have a PUBLIC DOMAIN copy of W5YI's novice test generator software. They sell test generator's for use by VE's etc. This is an example copy, and it works well.

Any suggestions where I should FTP it to? Simtel-20 comes to mind, but I'm not sure of the rules, I assume that there is an upload directory or something similar.

If you are like me, you are eagerly looking for an article telling you
how to open up the transmit frequencies on the IC-24. I have need of
transmitting in the ranges 140-144 and 148-150 MHz on military frequencies
for which such equipment is needed. I'd also like to transmit in the 420 band
for work on link equipment. I suspect lots of other folks have the same
need.

Now for the bad news: as far as I can tell, there is NO mod to open
the transmit range of the IC-24! If you know differently, please tell me.
If this is true, I think we should all complain to ICOM.

A little survey:

How much extra does it cost to do Ham plates in the state you're in?

Here in Mass., it's the same as vanity plates (I got tired of the
extra $50 or whatever it is and finally bagged them--figured that
it was more important to give that $50 to a worthwhile cause!).

I'm posting because mail to you bounced.

My IC-24AT will transmit in 140-144 and 148-150. I've had mine for about a month, so perhaps earlier models were slightly different.

I was surprised by this myself: The 1/4 wave whips for my permanent
mount cost $3.00 to replace and take about 10 miniutes to cut, install,
and tune.

Bill Gunshannon has a great idea! Since the anarchy on 11 meters is quite
beyond the capability of the FCC to control, they have just abandoned all
efforts. Adding a load of packet activity probably won't be noticed, and
certainly won't be any worse than the activity already there.

CT is indeed a pleasure to use....the later versions support a few more contests than the earlier versions did. The list of contests now supported are as follows:

CQWW DX
ARRL DX
CQ WPX
ARRL Sweepstakes (beta version still being tested)
ARRL VHF
Worked All Europe (WAE) DX

Subj: Re: LORAN and Ham Radio

According to "Reference Data for Radio Engineers" (1977, Howard W. Sams),
there are 4 types of LORAN: A, B, C, and D. A is

there are 3 types of LORAN: A, C, and D. A uses pulse envelopes at 2 MHz
and is usable to several hundred miles; C uses 100-KHz coherent pulses and
is usable to over 1000 miles; and D is a short-range version of C. All
three systems require at least three transmitters.

This is a very simple description, and the book doesn't give any references.
It does show the assigned frequency ranges as 90-110 KHz for L-C and -D,
and 1800-2000 KHz for L-A.

Real Hams drill holes, or have them drilled for them. The installation of the radio in the car is much neater and less of a kludge. No more coax snaked into the window, down the back seat etc. No more worrying if the door was closed on the coax.

BTW to clairfy one other myth, drilling HOLES does not usually detract from the trade in value of an auto. True story to follow:

There was this ham with a hole drilled in his car. The car was fairly new but he felt it time for a new one. He was negotiating the deal when the salesperson noticed the antenna mount on his car. The salesperson mumbled about having to take it out, costing a lot of money for the work, and so he would have to take off $750.00 to $1000.00 from the trade. The ham was appauled, but thinking rapidly said to the sales person, "a thousand less ??!! No, You mean $500.00 MORE !" The salesman was alarmed and puzzled. The ham went on to explain thet the car was "already wired for a cell phone antenna".

And so it went. Next week the ham drove by the dealer and there was the car for sale with a large sign proclaiming "wired for cell phone !"

I recently read an article from QEX about DSSS, and the use of vertical retrace from a local TV station to synchronize the noise generators. That eventually gave me a totally different idea ...

I can see where it would be useful for packet nodes to know their location to within a few hundred meters. Besides helping the operator when they get lost looking for a garage sale, it helps the terminal know what cell it's in in a cellular access system.

If there were several beacons in a city which can be received simultaneously, and for which the positions are known with high accuracy, a receiver ought to be able to determine its location. This requires that it know its initial position, and that it notices discontinuities in beacon patterns. It also requires a protocol for mobile stations to query permanent stations for certain local parameters. (I haven' figured out yet whether it's possible with a sceme like this for a station to completely determine its position with the help of one or two permanent stations. If so, it would greatly ease the configuration of a metro area LAN. Only a few of the fixed stations would have to get out the survey maps and determine their position to within 1m.)

The two regular beacons I can think of are the vertical retrace of all the local TV stations (6 here in PDX, 7 if you can hear Salem), and all the stereo beacons of all the local FM stations (a dozen or two).

With both of these beacons the problem for positioning is that you can only determine delta-x and -y from some known starting position. You must then watch it change and update your position accordingly. With the 19kHz stereo beacons, there is the additional problem that one cycle of 19kHz propagates about 10km before the next cycle starts. That means that if you stop listening in a moving car, you may have the wrong idea of where you are when you start again. The problem with vertical retrace is that the relationship of this between stations may change instantaneously when a station switches to another program (network feed from tape, etc.). Receivers would have to monitor several stations to notice this and apply corrections.

The Really Big Problem with both is the regularity of the beacon. Someone told me that the frame rate for color broadcast is not the same as for B&W. In any case, TV's should be relatively immune to irregularities since they resync for every frame (within limits). For the 19kHz stereo beacon, much averaging may have to be done to get a useful time reference. It may still be bogus if the beacon drifts around as humidity, temp, or phase of the moon (i.e. slowly).

Do these signals tend to be generated by crystal controlled devices? If so they may be regular enough for positioning. The thing is, unless regularity is required by the FCC, there's no reason for broadcast equipment makers to design it in.

My question to all of you (yes, finally, the point :-)) is what is the accuracy of the vertical retrace signal and the 19kHz stereo beacon? What is required, and what is usually there. If some of you have worked in the broadcast industry, you may know this off the top of your head. (I'd have to bring a scope home from work and open up the stereo to figure it out, and what I find may not be generally true.) References to appropriate documentation are greatly appreciated.

To get positioning info accurate enough to tell what cell you're in, beacon accuracy of a few uS is needed. To tell what road your car is on, beacon accuracy in the tens of nanoseconds is required. I have a feeling these beacons in the broadcast band aren't even close.

Thanks in advance,
--- Scott Peterson

Hi Phil,

>1. Since when was there a "forsale" group? I've never see this one added.
>   The discussion that created .swap considered that named and chose this
>   one instead.

Sorry, there's a group here by that name, it's probably some mistake.
I really don't think anyone would be confused if it was swap or forsale.
Upset -- maybe! Confused -- no! I see thigs "forsale" in "swap", I'd
expect to see "swap" things in a "forsale". You could even call it
"hamfest" (as I expect you know, you can buy new and used stuff at a fest.)
Of course if it was called "hamfest" maybe those postings for MIT hamfests
would get out of my face since I'm not driving 3000 miles to be at one.
The point is that "swap" is just fine.

>2. Why the cryptic name for the discussion group? And how to you DEFINE
>   what constitutes a "discussion"?

Other groups often use the ".d" suffix to denote a discussion group.
Calling it "rec.radio.ham.discuss" would be fine.
The reason and definition would be to seperate the issues from the facts.
In other words, if you post a technical question that gets a lot of
responses, that's fine. However, if you post something like,
"CALL FOR DISCUSSION" or "SHOULD THERE BE A NOCODE LICENSE" or
"PUMP-UP MOVIE BAD FOR HAMS" or "FCC PROPOSAL", or almost anything
that starts with a "RE:", these are postings that are likely to generate

lots of comments, observations, opinions, and long discussions.
(just like I'm doing here, now). As you notice in what I'm writing,
there is no "question" that I'm trying to ask, there is no one answer,
we are discussing an issue. And that is good and useful, but it's not
a technical question that can have a technical answer. Of course you
could take a contrary viewpoint, but that would be a discussion. Yes?

>3. It has been proposed the have rec.radio.swap instead of rec.radio.ham.swap
> so what is your reason for not having that?

I missed it. (Sounds fine to me, but I don't look forward to someone
trying to sell me a FM table radio.)

As to why I changed my mind, the more a topic gets splintered, the more
likely I'll miss something. Since I don't always have time to read all
notes, splitting the discussions off into another group will just
make it easier to skip the ones that I'm not interested in. Or save them
for when I have more time.

THANKS for listening

Richard Artz / N0LZR / 303-229-2036 / richard@hpfcww.fc.hp.com

For your 100m link, consider 10GHz. Lots of folks (not me) have made
significant progress in this type of hardware - like achieving ethernet
speeds. Since the signal isn't even close to omnidirectionally transmitted
(assuming dish or horn antennas), you might be a little less concerned
about the content (go ahead, send rec.humor) - not that I'm endorsing
this of course.

Or maybe use unrestricted frequencies - visible or IR light. A couple of
pairs of binoculars with light emitters (LEDs) and photodiodes at their
foci might make a dandy full-duplex link. The antennas are the right
size :-) I've always wanted to try this out but never find the time.

>
> This simply begs for a flame from Bob Carpenter! :-)
> etc etc ....

If he means millihertz, who am I to bother him .....

All this talk of FM stations takes me back to the early 60s when I put WHFS (FM) on the air, marrying an H.H. Scott stereo generator, old RCA exciter and 1 kW rig that Maj. Armstrong had used in demos - which had 25 Hz power supply components since it had been used in upper NY state. (Niagara Falls generated 25-Hz power up to the 40s). All except the stereo generator had been used to get WASH (FM) on the air in the late 40s. But I had to saw the transmitter into 3 pieces to get it through the door at WASH.

To get to the point, I never did call "CQ 3 meters", but I came close... We had a 15-minute ham radio program each Sunday; talk about TRYING to go broke... Actually it was the next two or three owners who went broke. The latest two transfers of the station (102.3 MHz, Bethesda) were for $2M and then $7.5M, however - for a Class A FM. We sure got out too early!

73, Bob W3OTC

I have been working on a solution to my touch lamp RFI problem. I borrowed my neighbor's lamp and tried installing a line filter in the base of the lamp. The filter reduced the noise level only 1 S unit. Since the lamp base cannot be grounded, common mode noise was not suppressed by the filter. Finally, I bought another touch lamp at the local builder's warehouse store. They had hundreds of them in several styles, all from the same distributor. I removed the base cover and discovered that the controller had been redesigned. It contained fewer components and was rated for 150 watts. There were still no RFI supression components (chokes or capacitors on the AC lines). The original was rated for 100 watts, and the neighbor had installed 3 40 watt bulbs, exceeding the rating. I could not hear any additional interference with the new lamp, but the neighbor's lamp was still plugged in, so it could have been masking the noise generated by the new lamp. I gave the new lamp to the neighbor, and told him to leave the old lamp unplugged. On returning to the shack, I could not find any interference from the new lamp. In case the information would be useful to others with touch lamp RFI, the manufacturer of both controllers is Darjung Industries, Taiwan. Model DLP-22 is the older design with RFI. Model T-30 is the newer design which did not cause RFI.

My method of tracing RFI sources is to carry my ICOM 735 around the neighborhood powered by 12V gel cell in my back pack. The antenna is a 2 ft. diameter shielded loop made with RG-8/U, matched to the ICOM with an L-network. The loop tunes from 10 to 30 MHz and has sharp nulls in the broadside direction. I was easily able to localize the source of the interference to the house and the interference was heard within a 3 block radius. Touch lamp RFI sounds like a growling buzz on an AM reciever, with a peak around 10 MHz and sidebands every 200 KHz from 5 to 25 MHz.

After working an XT last night on 15, I compared 4 different sources and
can't come up with the right answer to this question:

What is the current and proper name of the country that XT belongs to?

The operator I worked (XT2BK if I remember right) said the name, but I
missed it due to QRM/QSB. It didn't sound like any of the names I had
listed:

Bukina Faso (sp?) (DXCC country list, PacketCluster)
Voltaic Republic   (Beam heading chart)
Upper Volta   (Soft copy of an older DXCC list)

Any definate answer?

Riddle me this...

I have an Astron RS-35M power supply (12v @ 35 amps). A few days ago, using this with a HF rig,I was "tuning" my dipole with a MFJ 949D tuner II at low power (about 5 watts). In the course of setting the inductor selector and antenna matching capacitor on the MFJ tuner the Astron simply "shut down". The Astron has amp and volt meters and the voltmeter which always reads 13.8 volts was reading only a few volts. I shut the Astron off, turned it back on, and agin it showed 13.8 volts. No fuse was blown, no smoke.. and I doubt that in the course of tuning by transceiver it was pulling no more than about 3-5 amps.

This happened a few times. Each time I turned the Astron off and then back on and it was fine. Three times and I gave up since I knew something had to be wrong.

Tuning another antenna this evening (a long wire) it happened again. Low power, CW, key down, 5 watts and the Astron shut down - this time for the last time. It didn't recover. Its "red" power light is on, no fuse blown but no voltage.

My guess is that the problem has something to do with RF getting in the power supply - what else could it be ? Clearly, pulling a few amps for antenna tuning wouldn't burden this 35 amp supply and no fuse was blown.

Looking at the schematic of the power supply I see 3 curious capacitors in various configurations on the heat-sinked power transistors with the note "C7-C9 added for R.F. bypassing".

What does RF have to do with a power supply. And, why has my Astron "shut down" on such a low power demand ??????????????????????????????????

Wondering....

Anybody got an answer.... or a guess ?

In northern Virginia where I used to live, there was a large discount store (Sam's) right under one of Bell Atlantic's cell sites. After ECPA passed, I took great delight in going through the television department and playing with the UHF tuners on all the little tiny cheap TVs (all of which had analog UHF tuners), retuning them to output the Cellphone traffic, much to the dismay of passers-by. One of them even asked me if that was cellular telephone and I told them "yes." He said he thought is was "private" and I asked him how he could possibly believe that BS if every TV set in Sam's discount store could recieve it. He decided that in the future he would be much more circumspect about what he said on his cellphone.

Oh well, one at a time, I guess....

After the announcement of a new radio amateur licensing class in last December (Communicator class, 432 MHz only, all modes, no code test required), the number of new hams in Finland really boosted.

In our little Radio Amateur League of 5,000 members, a rush-in of 500 new faces (and voices, of course) compared to the previous growth of around 50 is really good news. Imagine ARRL growing 10 % in 6 months! There are about 5 million inhabitants in Finland.

Our age profile is not as much inclined to "old farts" as in ARRL, but definitely there is room for improvement. These new hams are mostly young and fresh power. There is a possibility to upgrade to "Basic class" (HF CW except 14 MHz & WARC bands, phone on 28 MHz; all modes on 144 MHz, 432 MHz) by taking the CW test only. Other than that, the exams are identical.

I don't work for the League, so I don't have exact figures. If you are interested, write for more information:

SRAL
box 44
00441 HELSINKI

Go no-code now!

By the way, I am a keen CW operator myself, when not busy teaching on a novice course..

A point that should not be lost either is that writing software is a perfectly valid form of homebrewing. The same people who might have been building their own vacuum tubes, capacitors, etc yesterday are probably writing software today. Nowhere is this more true than packet radio - it will be software that makes packet radio valuable to its users, not hardware. And, speaking from the standpoint of having built a commercial hardware/software networking package, the hardware is the easy part. Note that I am not attempting to start a hardware/software jock flame war - I play both fields, and certainly the world needs both specialties.

Do you realize some of the profanity that goes on over cellphone?

Do you realize the potential dangers that exist with any consumer
device that can receive cellular telephone signals getting into
the hands of children?

If only Jesse Helms (the artificial art official) knew...
but would he ban cellphones or UHF TV's or what?

Another, even simpler method is: buy gel-cells that don't require
current limiting.

Sonnenschein (a German manufacturer; I think that's the right spelling)
sells gell-cell batteries that are generally similar to those of other

manufacturers, but they state that charging simply requires a constant voltage of 2.3 V (+- 20 mV) per cell. Even when deeply discharged, the cell limits its own charging current to a value that won't damage it.

At the risk of starting another flame war, here are some practical suggestions.

In article <22480014@hpcuha.HP.COM> nicholso@hpcuha.HP.COM (Ron Nicholson) writes:
>What is recommended for HF transmitting when a ground isn't available?
>Example situations: multi story apartments, hotel rooms, roof top
>stations, mountain top portable stations, or air mobile (aircraft
>operators permission, of course :-).

Any antenna that doesn't require a "ground mirror" should work reasonably well. This means an antenna that is an electrical half wavelength or a multiple of a half wavelength. Almost anything that is a reasonable fraction of a wavelength or bigger in size will radiate to one degree or another and non-resonant antennas have been used for years, but in general the simplest antennas are an electrical half wavelength.

>Do balanced antennas, balanced feedlines, or various matching networks
>help keep RF off the radio case? Are counterpoises effective and do
>they radiate?

Balanced feeders and balanced antennas should keep RF off the radio, but I have seen cases where this was not true. Generally in those cases just changing the feedline length solved the problem. End feeding a half wavelength antenna requires a high exciting voltage since you are at a high impedance point, center feeding a half wavelength requires high currents since you are at a low impedance point. When you use a feedline, it's length will transform this impedance as seen at the source to something else. Thus you could have high RF voltages at the transmitter from a center fed antenna or high currents at the transmitter from an end fed antenna. Generally, having high voltages at the transmitter is the nastiest case from a "hot chassis" point of view. In theory a perfect match to the line prevents these problems, but in practice, you are unlikely to get a perfect match across the band.

A counterpoise can be effective and it can radiate, this is one of those "it depends" questions. So much depends on the installation and physical surroundings that a general theoretical answer just won't do. You must cut and try, measure and experiment to get a working system. A half wavelength counterpoise directly connected to the ground terminal of a transmitter should present a high impedance and a high voltage at the chassis. A quarter wavelength counterpoise should present a low impedance, low voltage connection at the chassis. Due to coupling effects in the nearby enviornment this may not work out. You may have to adjust the length of the counterpoise or use a matching network to get the desired results across a band. A short answer is that a counterpoise must radiate to work.

>Also, how can base fed vertical antennas without an earth ground be
>decoupled from the feedline?

With coaxially fed antennas, a quarter wave decoupling sleeve is effective, or you can try a ferrite choke over the feedline. With balanced feeders, it is generally impractical to decouple the line from an ungrounded base fed antenna. A base matching network that transforms the balanced line to an unbalanced feed for the antenna should work, but generally the feedline still develops common mode currents that are difficult to suppress. Again this is more of a physical problem than an electrical problem. Induction of the radiated energy, either direct or mediated by a conductive object in the near field, will often induce currents on the line.

The S.M.A. Fathers are a group of Irish Missionary priests who have a mission in Tenafly, N.J., a town in northern Bergen county. There are many missionary priests in Liberia, and the Fathers are having trouble contacting them by their usual channels. A friend asked me if I knew anyone who had a ham radio who would be willing to help them reach Africa, to find out how things are going with them during the current troubles. I don`t know exactly what they are doing at the moment since I don't speak or understand "HAM," but if you would like to help, or find out a little more, please get back to me here at email and I will pass your info to the "Irish Ham." Thanks for any help.

My sentiments exactly. I like the way threads mutate over time, and with splinter groups I'd miss some interesting stuff.

I vote NO.

I haven't seen the film yet, but it's quite possible that it's a MODIFIED ham transmitter. As I did in 1969...

I took a 1956-vintage Tecraft TR-20/50 and converted it to the FM broadcast band. The classic 3-tube design (Osc/tripler, doubler, final) was easy to modify to have a doubler in the final (a 6360). Then to boost the power, I eventually added a straight through final. The modulator was a Heath VF-1 with a power diode added as a varactor. All ESTDs (toobz).

A subsequent owner bought a cheap Precision Electronics stereo generator and got the whole thing running in stereo. Norton (the Tecraft's name) did faithful service...

The story thus far:

Several of us have ben trying to set up a shack on campus here for a long time. We finally have gotten an initial approval for the idea, and are now writing up a proposal and shopping list. The shack is to be used for regular use, but is also to be dedicated to emergency use. If any of you on the net can comment about any of our equipment choices, please e-mail direct or post if you cannot.

For HF antennas, one idea is to use a Cuschraft R-5 for 10,12,15,20m and a butternut HF2V for 40,80m. Any ideas for beter choices than the butternut? The other idea is to use a cuschraft A3s for 10,15,20m and add the A743 add-on for 40m. Any ideas on how well this works? It would be quite nice to get some gain on 40m without a dedicated, large 40m beam. For 80m, again, the idea is to use a butternut HF2V.

A Kenwood 440s/at is the HF rig choice, due to it's small size, decent cost, built-in tuner, and reliability.

We are considering getting a linear amp, and the ameritron AL-80A looks like a good choice, due to it's high output, small size and portability.

Thanks again for the responses.

The first radio I ever built was the old Lafayette Explor-Air super regen SW receiver when I was a kid in the mid-60's. I built it using a soldering gun (remember when you couild get away with that?). That radio is long gone, but I found one at a hamfest recently, and picked it up for nostalgia's sake.

Unfortunately, it doesn't work very well, and I'd like to fix it up.

Does anyone out there in netland have a copy of the schematics and/or manual for this radio, or for a similar rig?   It used that neat trick of the using a tube set whose filament voltages added up to near 117V, thus cutting costs. Many super regen radios used the same tube set, and I assume have similar circuits.

I'd be glad to reimburse for copying & mailing expenses. Either a reply here or direct email (elkind@crboss.enet.dec.com) is fine.

And there is a computer convention that whereas "k" refers to 10^3 (1000) "K" refers to 2^10 (1024), thus 2 kbytes = 2000 bytes, and 2 Kbytes = 2048 bytes.

I just can't resist this.

When I was working at the mountain transmitter site of a local TV
station.  We were required to wear hard hats when entering or leaving
the building during the winter.  This was to "protect" us from the 200
pound chunks of ice that fell off the top of the 600 foot tower and
made all the 3 foot deep holes all over the ground.

Run the 50hz AC through a bridge rectifier followed by a small 1:1 transformer.

I am surprized that no one has noticed that the FM transmitter
in "PUMP UP THE VOLUME" is nothing more than an HP 608 signal gen!
It's there in plain sight ...no TS-440's or ICOMS or anything...
just a good ole HP608. The '608 even goes mobile in a jeep
using a little gasoline generator when Hard Harry is being stalked
by the FCC in these silly yellow vans.   There is no mention

```
explicitly of 'amateur radio' in this movie...only 'shortwave'.

...For the record (which apparently isn't straight)...

    Hey! So this isn't the case of a converted 160m transmitter. I doubt
that most hams could modify an old HF radio to transmit wide-band FM
on 92.0 Mhz. Now, I'd doubt even more that there are many high school
students who could do that.

Hi. I'm an advanced class ham, I own a Sun 2, and am about a hundred meters away from an internet site. I could, conceivably, make a packet radio link on 900 Mhz or something to link my site to the internet site down the block and thereby get on the internet (ignoring administrivia for the moment - this is a a technical and FCC-legal excercise).
The trouble is if I operated this under the auspices of my ham license, I'd have to insure that all the stuff that goes over that link is ham-legal. rec.humor would not qualify, obviously.

What alternatives have I? On the building at the internet site, I can put up as good an antenna as is necessary. At my end, however, I have the usual condominium restrictions, but an outdoor loop antenna or a small UHF beam would not be too much of a problem. With this in mind, I can probably get away with less than a watt, probably less than half a watt.

With all the talk about wireless speaker installations, etc, I'll probably be the black sheep for suggesting it, but can I operate in 902-928 with low power under part 15 for this application? Is there any other LOW COST alternative? I am only doing this to save myself having to use the phone all the time to transfer news, etc. If it's going to cost me more than time and buying the gear, I may as well use the phone.

Now technically: SLIP will be operating on the serial link, so error correction or detection/retry is not necessary. To make it simpler, full-duplex would be best. Is making a simple FSK transmitter/receiver for each end the best way? How much of a shift is necessary to achieve 19200 baud? How close can I get the two signals (one each direction) without buying duplexers? Am I wrong about this being the best way to do it?

--

It may be more convenient to use the list in the back of the post office zip code directory. It lists every zip code, in numerical sequence, followed by the name of the town.

There is also a little book published by Pilot Books that allows you to link zip codes to telephone area codes. This is very useful for multi area code states, where the area code boundaries are not obvious to those of us from out of state.

The book from Pilot is only $3.95. E-mail me, and I'll send you their address. I have the book at my office, and I am at home right now. Otherwise I would post it.

After reading the articles on GROWLING interference from touch lamps, I decided to see if my touch lamp was the source of interference on my DX-440 receiver. When I pulled the plug, silence followed. I was putting up with harmonic bleed-over on nearly every band. Now I don't have to any more. Don't underestimate the nasty noise generated by these "touch lamps from hell".

While the magmount antenna LOOKS more like it can be stolen, the permanent antenna installations can still have at least the whip and spring portion taken. I guess that is less of a loss, and less likely to happen, but it would be a hassle in any case.

|> [...]   ...it might make sense to require
|> stores to see a copy of your license before buying anything that transmits.
|> Before you rent a plane, you gotta show your license.

That's because the renter is concerned with identifying you in case of theft and is also concerned with liability laws. You don't need a pilot's license to build or buy an airplane.

|> Before you rent a car, they gotta see your license.

Same thing. You don't need a license to buy or build a car.

|> Before you go fishing in a managed area, you gotta show your license.

You're probably thinking of some law local to you. It's not a general thing. But in any case, fishing licenses don't prove you know how to fish -- they're just a method of collecting taxes. Not a good comparison.

|> Before you buy a handgun (in some places) you gotta show your license.

But not all places. Flawed again. In NH you have to show your driver's license. Maybe this means we shouldn't sell transmitters unless the purchaser can show a dog license, it makes as much sense.

|> Before you buy alcohol, you gotta show your ID.

HA,HA,HA,HA,Ha,Ha,Ha,ha,ha,ha! You kill me! What a sense of humor.

|> This idea isn't without precident.

But it IS totally without merit. Maybe that can make up for it.

In the case of hams, though, there could be one
|> exception. If you're trying to get a ham ticket, and you want to buy a
|> transceiver, a signed affidavit from a licensed ham stating that you're under
|> his supervision and that you'll be responsible if the aspiring ham messes up,
|> until he gets his license for real. (Elmers still exist, don't they?) I
know
|> that new laws are usually stupid and not thought out, but this one might
|> actually make sense.

No, I'm sorry, it's stupid and not well thought out. It was stupid and not well thought out when Phil Howard proposed the same thing last year. Who the hell are you to tell me that I need a note from some overbearing old fart that says I'm *allowed* to have a radio because I'm being supervised? Beyond that, what is the liability if I (as an overbearing old fart) certify someone who decides not to get a license? Do I have the right/responsibility to confiscate the radio? Does the store that sold it have to buy it back at full price even though it took a few years for the owner to decide they'd never take the test? What are the people at flea markets supposed to do? What happens in the case of private sale? What if you don't live anywhere near a ham and so don't have an overbearing old fart who'll sign your note? What if your license expires, but you still have an old transmitter in the garage?

I know you're trying to come up with a solution to something you percieve to be a problem. I don't believe it is as big a problem as people who like to worry about it wish it were. In the only instances above where you cited licenses that are supposedly proof of ability to operate (cars and airplanes), there is no precedent for making a license required to buy the item whose operation is restricted. It is illegal to operate a ham transmitter without a license. The FCC *is* prosecuting cases where unlicensed operation takes place. There is no need for a "fix" that will open up a whole rat's nest of liability problems and make it even harder for new hams to join up.

I have a non-working radio for parts or repair.
Best offer takes it. Looks new on the outside, never been opened.
So far the high bid is $30. I have a owner's manual which contains
a reduced size schematic that would be usuable if you enlarged it.
The product is featured in the Grove Enterprises catalog and is sold
under several other brand names. It is identical to the Realistic
DX 440 for example. Current Grove price is $196.00 plus shipping.

Here's a little more info on the unit:
AM/SSB/CW reception from 150 kHz to 30 MHz
FM from 87.5-108 MHz
Keypad frequency entry and tuning dial. Illumninated LCD freq. readout
Scanning with 9 memory channels. Wide/Narrow selectivity switch.
Bass and treble controls. Direct selection of 12 SW broadcast bands.
Clock with preset freq. alarm and sleep function. Battery or AC power.
Headphone jack for stereo FM listening. Five step led signal strength indic.
BFO and RF gain control. External antenna jack.

|> The various levels of Amateur Radio licenses were not designed to generate
|> a 'caste' system.   There has never been anything that states that an
|> Extra class licensee is in any way better than a Novice licensee!!

Gee, I don't want to be the one who speaks the discouraging word after your wonderful and should-be-true-even-if-it-ain't posting. For the most part, I genuinely agree that it is attitude that makes the ham, and that people should realize that usenet isn't ham radio. (That's why I support the creation of rec.radio.ham.armchair_lawyers -- so my kill file doesn't have to do all the work.)

However, I think you're mistaken on the caste system issue. The additional frequencies I got as an Advanced are not even slightly related to the additional privileges provided by the license. In fact, there are no additional privileges besides the HF frequencies. When I upgrade to Extra, I'll get a few more slivers of HF frequencies that are in no way related to space operation or being a VE, which are the only new privs bestowed. Clearly, there was effort put into designing a system that creates castes.

To me, in human terms, it makes sense -- the design seems pretty much a copy of the mind-set of the times it was created in. The fact that the design is considered faulty by today's standards is somewhat beside the point. Change will happen, even if it doesn't happen at the pace some people wish for. But there is clearly a designed-in bias which makes it easy to develop an attitude of superiority/inferiority based on license class.

In an earlier article I (Ron Todd) write:
> > Gary, it could be either. What is a 6db voltage (or current) ratio is also
> > a 3db power ratio.

The opperative word was ment to be RATIO. A 2:1 voltage ratio is 6dB while a 2:1 power ratio is 3dB. Maybe what I said didn't sound like what I said. The

There was a lot of discussion about S-unit definitions back in the 40's thru 60's, ARRL handbook gives some hint about it, the relevant text is unchanged except for typos from 1978 thru 1990. Some manufacturers wanted a base s-9 to be 50uV others 100uV, the variation in scale factor was from 3dB to 6dB in definition and from 3dB to 8dB in practice. In the past receiver sensitivity was specified in microvolts, currently it is appropriate to specify receiver sensitivities in decibels relative to miliwatts. As a result, the dB definintion of an S-unit could be viewed as having changed; a doubling of the microvolts would result in a 6dB S-unit scale while a doubling of the miliwatts would result in a 3dB S-unit scale. So, Gary, it could be either.

The following is the WEFAX Schedule as of 02-AUG-1990. All transmitted maps are black on white with the exception of the GOES photos. The latter are grey-scale. All transmissions are 120 lines per minute. If your TNC has a WEFAX mode, you'll be able to copy these maps very well. The GOES photos will even give you a good indication of cloud cover even if you lack grey-scale capability.

I'm getting ready to purchase software for my IBM (clone) PC... 386, 25MHz, no co-processor, Super VGA (800x640). I've narrowed the choices down to InstantTrak and QuickTrack (both available thru AMSAT), but I'm not sure how to choose between the two. Could anyone out there who has

used (or seen) either of these products please offer any recommendations
or comments? With the SAREX launch upcoming, I'd like to get this as
quick as possible.

Also, does anyone know if AMSAT will take a phone order with a credit
card?

Also ^2, I'm not currently an AMSAT member, which means an extra $20 on
the cost of either of the two packages. The annual dues are $30, which
would be an extra $10 more. What EXACTLY are the benefits of joining
AMSAT, besides the lower price on the software (and the knowledge that I
am helping out financially to support their work, which I know is
important)?

TNX in advance!

73 de BJ, KM4RB

I use a DB Products 5/8 mag-mount on my Ranger pickup. It does at least as good a job for my 25-watt rig as a 1/4 wave hole mount on as similar vehicle with a 40-watt rig. The only problem I have with it (and it's not really a problem - just an inconvenience) is I have to watch out and not use parking garages unless I tilt it over first. I could have gotten one with a spring attached if I had been thinking.... oh well. I ran my coax to the bed-illumination light and fabricated a metal plate to replace the light itself. I mounted an SO-239 connector on the plate, ran the co-ax to that, and cut off all but a short piece of the coax that came with the antenna. This way, I can use it on my XYL's car (after lots of QRM) for temporary installation, using an extension piece of coax. I like the mag-mount.

                  ^^^^^^^^^^^^^^^^^^^
     The author mentioned his information came from an R1.... I have the IC-24AT
   (USA version) and have just purchased the BP-90 (this allows one to use "AA"
   alkaline or NICAD cells)... The manual (sheet) that came with the BP-90 states
   that it CAN be charged either with the IC-24AT or the AD-14??? (I am not
   sure of this adapter number, not having the instructions in front of me now).
```

The IC-24 will charge NiCds in the BP-90.

The clip on style charger will also.

The drop in quick charger WILL NOT. There are no connections on the
outside and no current sense dimples either.

Hope this helps...jv

RE the policies and standards issue, I know it's old, because I have been using
this as a disclaimer for some time. It was taped to a desk I inherited over 15

years ago. As for KHz vs kHz, anyone who has brains enough to pour water out of a boot will know it means kilohertz, so what difference does it make? I average about 5 digests a day from this news group and 90 percint of it is wasted airspace, so I figured i might as well add to it.

Press on with pride. It's obvious most of the posters don't read what they write.

i just worked a guy last night that was running 8 watts on AO-13
and he was 5x7 - very nice signal !!! he was running a homebrew
10 element 435MHz antenna, and i was using an old 2m cushcraft
antenna (w/ an ok preamp) on my side -- i'd say this adequate

equipment was doing a pretty good job...

joe ka7ldn

ps. phase3-d should help, the uplink power level requirements will be less, and it will downlink more power than phase3-c.

KANSAS CITY, Mo. (UPI) -- US Sprint has expanded its Military Affiliate Radio System to allow military personnel stationed in the Middle East to call loved ones back home for no charge in the event of an emergency, the company saidMonday.

The MARS program, which uses a combination of amateur radio operators and US Sprint's digital fiber-optic long-distance network, has been used as a calling program for military personnel for seven years.

Medical calls from the hospital ships ``Mercy'' and Comfort'' and all emergency calls put through by the Red Cross will be completed for free, company officials said.

``This program has meant a lot to service personnel during holidays, and we felt it might be needed now more than ever,'' said Ron LeMay, president of US Sprint.

``We are glad to provide this service at a very difficult and stressful time for military personnel and their loved ones back home,'' he said.

Under the program, amateur radio operators in the United States will receive calls through MARS radio carrier signals in the Middle East. The calls then will be put into the US Sprint network and routed to their destination without charge.

The MARS program has allowed military personnel to place free calls on Christmas, Thanksgiving, Independence Day and other holidays.

US Sprint is a unit of United Telecommunications Inc., which has headquarters in Kansas City.

A 3 dB change in a single (roughly) doubles it's power. Period. All things being equal, a 6 db change in a signal will double it's voltage. Since all things ARE the same, doubling the voltage will double the current, quadrupling the power.

The conceptual problem that most people seem to have trouble with is that you can't change any parameter in a vacuum. Ohm's law applies in any real world application that you are likely to consider. (Ohm's law is like Newton's, there ARE cases where it doesn't apply, but few of us are likely to encounter them).

More Trivia... The dB stands for Decibel, that is Deci-Bel, or 1/10th of a "Bel". The Bel is a unit of _power_ devised for measuring sound levels by, you guessed it, Bell system engineers (in the 20's? teens?, I dunno). It turned out to be a little big for it's original intended purpose, so it was subdivided into the decibel. The original goal was to develop a unit of measure that represented sound power changes as percieved by listeners.

The decibel turned out to be very convenient for a whole bunch of applications because it simplified the mental math required. Complex multiplication became relatively simple addition.

>performance by DRILLING a HOLE in the car and doing a real installation.

Maybe so, but in many cases people might not *need* superior performance.
I've gotten along just fine for years with mag mounts. Unless you're
marginal into the repeater (or into the other station if you're working
simplex), who needs the extra oomph?

I thought that drilling a hole in my 1971 Opel GT wouldn't be traumatic
since it was so old and a little banged up. But after I did it, I swore
I'd never do that to a car again.

It all comes down to needs and priorities. If mag mounts or clip-ons
are working fine, why drill holes?

Patty

p.s. Thanks for the tip on the Perrier. :-) Does it work on rubber bumpers?
If not, I guess there's no use buying any for the Porsche.... :-)

>generate a negative attitude towards amateur radio. Any comments?

I saw "Pump up the Volume" this weekend. "Ham" or "amateur" radio is never mentioned at all in the movie. In fact, the only reference at all to the radio equipment used comes when the main character says that his father "bought him a shortwave radio so he could keep in touch with his friends back east." Interestingly, there is no mention about how the pirate uses his "shortwave" radio to broadcast in the FM radio band.

I seriously doubt that anyone seeing this movie will make a connection, negative or otherwise, with amateur radio.

All things are relative...they are replacing a threw-the-window installation..... And there are other considerations like I wind up removing the antennas quite often to use them for ARES type work. For this Mag-mounts are great. Again it's all a matter of your intended use....for me they are the correct answer.

Yep, I saw it this weekend and thoroughly enjoyed it. First off, ham radio is mentioned EVER. I didn't see a single piece of ham gear in the movie. I did see what looked like an old HP signal generator(you know...the hernia producing type) being used as the transmitter(he went mobile with it? ;-)

The only group that came out looking stupid was the FCC. The guy protraying the head of the local FCC office (or whatever) had the last name of Watt? Wonder if that was in reference to a unit of power or a certain ex-secretary of the interior ;-)

Anyway the movie brought back lots of memories of my nefarious
youth, i.e. I had a good time.

> Also does anyone know what brand names Philips/Signetics cellphones are
> sold? (In US? In Europe?)

A friend of mine who works on cellular phones tried to simply move
the operating band of the thing up to the 900+MC ham band. Without
much other effort, it was fairly useless up there. The circulator/
duplexer doesn't hack it obviously, and the receiver and transmitter
pooped out pretty much.

It would take some component changes, meaning some custom machine
work, but I think his basic idea was sound.

We had intended to use these as link transceivers for a repeater system.
Right now we're using 450MC stuff, and it is getting crowded down there!

Any other thougths?

Good!

Wake 'em up!!

By the way, I saw the movie last night, so that I get MY facts straight.

The phrase "amateur radio", "ham radio", or the like was never mentioned.

"My dad gave me this shortwave radio so I could talk to my friends
back in New York."

He was on "92" (megacycles?). Unless that's some newfangled repeater
frequency, then I have never heard of it on any ham band.

There are quite a few FM exciter and amplifier kits available to
those who seek them out. Some are actually pretty decent, with
stereo encoders available as options.

Whadda ya all afraid of? Some pirate will have something substantive
to say while the rest of you are screaming blue murder at each other??

In a recent QST a review of the CT computerized logging program was
published. I am very interested to get a copy of this, IF, it can be
modified or customized to work in the UK rather than continental US.
For example, the article referred to CT's operation on the ARRL
Sweepstake contest: can it be modified for some of the RSGB contests
I wonder?

> WB4HVD

You are receiving an image (at 21.4 Mhz higher) of the cellular frequencies;   My PRO-34 also receives them.   However, once I made the modification to allow cellular, the calls are much clearer and there is no digital signal interference; i.e. when you are using the search mode you only stop on conversations.

The major users of the 800 mhz spectrum (outside of the cellular bands) are so-called trunked radio systems.   Many users, using a combination of CTCSS and a digital channel, multiplex conversations over a fixed number (6 or ten or so) of channels.   The digital channel allows the transceiver to pick an unused channel for each transmission, while the CTCSS prevents other users from hearing transmissions that are not of interest to them (of course since the PRO-34 passes the CTCSS signal, you will hear all users of the channel).

I'll throw my hat into the ring with another suggestion for new license classes. How about this:

```
1. "COMMUNICATOR"  2,3A   No code   All priv. above 30mhz (except CW side bands)
2. "GENERAL"         3B   5 WPM     Privs now enjoyed by General Class
3. "ADVANCED"     4A,4B  13 WPM     All amateur privs
```

This seems to be a compromise. Code requirements are greatly reduced, but they remain for the HF bands. "Qualification-based licensing" is reduced, but some elements of it are retained. The novice class license is eliminated, because it no longer makes sense if we're going to have a Communicator class. The novice class will just confuse newcomers ... "Is Novice better or worse than Communicator? ... difficult to answer, since the classes would not be hierarchically structured. The Communicator would be a good entry point into ham radio, since the written exams would not be that difficult, and this class would have good voice privileges. With only 3 classes, the licensing process is simplified.

Ken, that is *NOT* the whole point. To some people, and perhaps even many
people this is the point, and I won't try to tell them that they are wrong.

But where you are wrong is in ASSUMING that everyone subscribes to this
same "point". I for one DO NOT!

I am interested in finding out how far I can push VOICE communication.
Switching to CW or ATV just simply contradicts what I am trying to do.
I'm also interested in ATV and DATA DXing. In fact I am even interested
in CW DXing. But on the day I am doing VOICE DXing, you won't hear me
doing CW DXing.

> Cost effectiveness is not a justification for the CW requirement being
> levied upon licensees granted access to the weak signal portions of the
> VHF/UHF/SHF/EHF/etc. bands. It is just additional information that is
> relevant to the discussion at hand.

How is CW relevant to one who is doing only weak signal VOICE DXing?

I agree.... with the "if" included. But can we really do it that good?
Can we? If the answer is yes, then why haven't we over the past 20 years?

> This is the fundamental impasse. You claim that your buddy won't get

Well, he certain was not convinced of so much a benefit from ham radio that he would go ahead and learn the code. I don't believe we are going to be capable of doing that without a change of image of what ham radio is all about. The retention of the code test, however, is a part of the image of the "OLD Ham Radio". I think people today for the most part are just not interested in it, or have no concept of what it is. There is no "NEW Ham Radio" for them to even consider.

Most people seem to think that what us nocoders are trying to do (and some, I guess, are) is make the costs lower to get in. What I am trying to do is to make the PERCEIVED benefit match the REAL benefits that you and I know are here. The modern day benefits that most new people will be interested in have nothing to do with code. As long as the code is forced upon them, they will perceive ham radio as being a lesser set of benefits unchanged much from the 1920's.

If you can come up with a wait to convince people that the benefits of ham radio far exceed the effort required to get it (code is not that hard) then I am interested. If you have a means to convince 100,000 new people to go take a code test to become a ham, I'll withdraw my FCC petition and comments.

The old arguement about what level hams should homebrew on. How about this
one: Some of my friends who grew up in China say that they had to actually wind
their own deflection yolks and flyback transformers when they built their own
TV sets. Noone here (USA) ever does that! It would take too long, to figure
out the design, and to actually wind. Also, one of my friends says that he
built an antenna by using rods of bamboo wrapped with aluminum foil. Because
real aluminum rod is hard to find.
At the other extreme: I once saw someone on rec.ham-radio.packet say that he
builds packet networks, using store bought radios, TNCs, computers, etc.

Neighter of the above is more valid than the other, it just depends what you
want to do, and the resources you have.

Actually only the 6 meter and 2 meter bands have CW-only subbands, therefore
no UHF bands have any. The band plans accomodate this. I don't know if that

is good enough of not.

[included text reordered]

> So, Phil, how about your list of things you believe to be big obstacles to
> entry into the hobby? Something other than CW for a change.

The exams in general are a big problem. We will get to these problems.
The code problem, which may not even be the biggest, is the most glaring.
The squeeky wheel gets the grease and the code test is screeching loud.

> I stated once before, and I think it bears repeating: There are bigger

> large measure for the waning interest as *radio* as a hobby.

There probably are. Let's get the one before us through now, and get on
with fixing the other possibly bigger problems.

> I agree with Phil that all the advertising in the world won't make many
> people buy something they don't want (actually, none will). But it is also
> true that if people really want something, they will work to get it.

If they know they want it. I agree they would work for it. But if the image of ham radio makes them think they DON'T want it, you have the problem. I believe CW creates this mis-image.

> I believe that if amateur radio has a problem with piqueing the interest
> of youngsters today, it has little to do with the licensing requirements.
> It has a lot to do with the options they have.

Many of the options are here now. Many more could be made available. But if the perception of ham radio is still in the 1930's, they just push the Nintendo cartridge back in.

FCC rules regarding the rulemaking procedures requires that reply comments have a copy "served" (and US mail is apparently adequate) upon the person or entity that filed the comments you are replying to. This is an ordinary practice for all legal proceedings. The only reason you don't have to do this with regular comments is that they are effectively reply's to the FCC's Notice of Proposed RuleMaking, and since you are sending them TO the FCC, that takes care of it.

If you are unfamiliar with how to file reply comments, I strongly urge you to get a copy of, and read, FCC rules part 1 (that's ONE). Many college and university library documents section have the Code of Federal Regulation books. You want "title 47" which contains the FCC rules. The first book has part 1, part 2 (interesting reading: allocation tables), and part 15. The fourth book has parts 73-76 (broadcasting and cable), and the fifth book has parts 80, 94, 95, and something called part 97.

Also check out the Federal Register. It arrives daily. Look in the first
few pages where the agencies are listed in alphabetical order. Often the
FCC has nothing for some days. When the FCC shows up, you might find the
"articles" interesting. While they are mostly legal "mumbo jumbo", they
can give you a better idea of how our bureacracy works.

All doubtless quite true. For those whose situations may be different,
a different opinion: In Yellowstone National Park, the semi-official
geyser-gazer force, whether employed or volunteer, uses standard CB radios
and has a standard channel (30) for reporting eruptions, etc. They're
all scattered throughout the basins on their lonesome because that's
what geyser-gazing is all about - sitting on your bum waiting for
something, and no more than one person need wait for any given thing.

The Ranger force of course uses some Federal frequency and has repeaters
spotted on various mountaintops for coverage. The typical QRM problems
that make CB unusable most places do not typically exist out in places
like Yellowstone, so for those without licenses (which is most people),

CB in situations like this one seems to serve very well indeed.

I just seems to me that the model changes from Icom/Kenwood/Yaesu and others
are coming rather often, and with usually not many new features, particularly
in the VHF/UHF rigs, where this often means you can no longer get a matched
set of 144/220/440 (if you were so inclined).

How to convince people to become hams? Well, I tried recently! My 10-year old

nephew showed more than a passing interest in my 2-meter mobile & HT,
and the IBM-PC in the corner of the shack.. I explained to him that i was
able to send messages from the PC to (almost) anywhere, and gave him a demo
of packet. Then i explained to him about having to get a license to use it
and the need to pass a test in order to get the license. He seemed to accept
this concept without any hangups. I explained the license exam, and said
that you had to learn about how radios work and how not to be a nuisance
to others by jamming their radios/TVs. Still no hangups from junior op.
Then he asked 'Do you know morse code?'. My reply was something along
'Well, I personally dont, but some hams learn it, because those who do
are allowed to use different radio bands, which can go a lot further'. He
looked puzzled at this, but neither he nor i suffered any further angst on
the subject.
He then asked 'how much does it all cost'; i went on to explain that some
hams spend pots of money buying expensive radios, but others (like me) get
old cab despatch radios and convert them, and that this was much cheaper
as well as being quite good fun itself. I told him that my radio cost about
50 pounds sterling. This surprised him. (he had been to a local show at which
there had been a ham station with all the latest gear, and had been told by
the people there that radios cost thousands of pounds).
<Remember that parents are likely to object to forking out vast sums of
money on what they perceive might be a kid's passing phase>
I told him about the license exam and the forthcoming Novice license in the
UK, and he wanted more information..... which i have provided.
He was last heard saying 'Hey dad; can i get some packet-radio programs for
the Commodore-64?'.
Now somehow I feel that if I had said 'You HAVE to learn Morse because the
Government says you do', then his interest would have stopped dead.
Fortunately, the UK and many of the more enlightened countries of Europe
have had the benefits of a no-code license for some time.

To paraphrase Pink Floyd:- 'Hello? United States? This is the World calling.
Can you hear us?'

I don't know the costs--they probably aren't reasonable--but you can write or FAX the ITU. (I understand their response time isn't too swift.) Their address:

Union Internationale des Telecommunications
Place des Nations
CH-1211 GENEVE 20
Switzerland

[if you want to be strictly correct, put acute accents over the e's in Telecommunications]

FAX: 011-41-22-733-7256

You can find the tables of ITU frequency allocations (with footnotes) along with the US frequency allocations (but not the ITU resolutions, I believe) in a US Government document: "Manual of Regulations and Procedures for Federal Radio Frequency Management," available for $72.00 ($90.00 foreign) from the Superintendent of Documents, Washington, DC 20402.

There is a publication entitled, "Tables of Frequency Allocations and Other Extracts From: Manual of Regulations and Procedures for Federal Radio Frequency Management." (Catchy title, huh?) This document has most of what you probably are looking for. (I keep it handy on my desk.) I don't know what the cost is, if any; in the preface it says: Additonal copies of this book can be obtained by writing to the following address:

Executive Secretary, IRAC
U.S. Department of Commerce, NTIA
Room 1605, HCHB Building
14th and Constitution Ave. N.W.
Washington, DC 20230

I hope that information is useful.

Looks like it's time for another round. For those of you who've lost it, or just never saw it, here's the way to lookup callbook entries over the INTERNET.

+=(*)=+=(*)=+=(*)=+=(*)=+=(*)=+=(*)=+=(*)=+=(*)=+=(*)=+=(*)=+

The callbook server is accessed by sending mail to callbook@sat.datapoint.com. Include the following line in the body of your message:

```
     lookup <callsign> [<callsign> ...]
```

The maximum length of a lookup command line is about 200 characters. You may specify more than one lookup command if needed.

The following commands are also recognized:

```
          path - specify a return address (user@domain or
                   bang!path!user)
          help     - return this help text.
          quit - quit scanning for commands.
```

Path should not normally be needed, since the mailer should be able to resolve your address. If you do not get a response from the server, you might try including a path command.

Quit is not usually needed either, but may be used if you have a signature that contains things that look like server commands.

Examples:

```
     lookup n5lyt            <= About as simple as you
can be

     lookup n5lyt ns5i ka5pfm    <= Look up more than one
call

     path bob@foo.com        <= A bit more complicated
example
     lookup n5lyt
     quit
```

If you have any questions, send mail to callbook-help@sat.datapoint.com.

De Lee Ziegenhals N5LYT

```

Charging of Gell-Cell batteries

A Gell-Cell battery should be charged from either a constant voltage source or at a low current value. The Gell-Cell wants to be treated just like a standard lead acid battery in terms of charging and be maintained at a nearly full charge condition for life.

When charging off of a voltage regulated source, adjust the charge voltage to a value just higher than the full charge value of the battery. As the battery reaches full charge, the current will decrease. If desired, the current can be allowed to go to a "zero" value at peak charge.

When charging with a low current value, use a resistor and diode (in case the charge circuit voltage drops below the battery terminal voltage) in series and allow the battery to trickle charge continuously.

The one consideration when continuously trickle charging any lead acid battery beyond a full charge condition, the electrolyte will bubble releasing gas (hydrogen and oxygen). A noticable loss in water content will be observed as a result. It has been observed in a car battery under no load conditions, as an example, that a 100ma continuous charge dissipates water fast enough to require replenishment weekly. The life of a Gell-Cell battery will be shortened under a continuous charge situation where the discharge current never or rarely exceeds the charge current.

The bottom line is that a full charge condition of the battery wants to be maintained, but not "over charged". This is most easily accomplished using a constant voltage source.

There shouldn't be any reason that restoring cellular coverage should skip over the control channels unless you are only scanning the mobile frequencies, which isn't all that good of an idea because range is extremely short. It's easier to scan the base frequencies, plus you will typically be able to hear both sides of the conversation, although the mobile may be a bit faint but still readable.

For those of you that are interested, the cellular bandplan looks like this:

Bases

System A (non-wireline carrier): 870.030-879.990 (bases)

```
                                 825.030-834.990 (mobiles)

System B (wireline carrier)    : 880.020-889.980 (bases)
                                 835.020-844.980 (mobiles)
```

Channel spacing is 30 KHz. There are additional provisions incorporated in the bandplan to allow for more growth, but these are the most common ranges. There are 21 control channels for each of the 2 systems.
The control channels make up the highest 21 frequencies in System A and the lowest 21 frewqquencies in System B of the base frequencies in both cases. Listening to the control frequencies isn't much fun, but it's a handy way of determing how many cell sites you are in earshot of. Scan through the control frequencies and count how many times your scanner stops and you'll know approximately how many cells you can hear. The reason I use the term "approxmiately" is that two different cells spaced far enough apart can use the same control frequency, but you'll only hear it once for obvious reasons.

If anybody wants any more info on this cellular stuff, drop me a line.

Disclaimer: it's up to you whether or not you want to listen to cellular calls. I'm just providing information. Personally, I think the ECPA is a crock. But let's not start on that subject again...

Sigh. apperently, I still haven't made my point. I don't want CW abolished;
I just want CW abolished as a requirement for a license. I don't force you
to master current-technology transmissions (i.e. 9600 bauds or higher digital
communications), why do you want to force me to master an ancient
communications method, if I am not interested in that?

That's what the whole thing is about.

Last night Gary Buchholz was enquiring about my Barker and Williamson AP/10 apartment antenna. I basically described that it consisted of two parts, a car aeriel which you hung out the window, and a counterpoise that you draped around the room. Since the car aeriel was electrically short (52 inches) and did most of the radiating, the results were abysmal. Did Gary get the message which I sent him?

Has anyone seen an early showing of _Pump Up the Volume_? It is a movie about a high school student who uses a ham radio to start his own bootleg radio station. It is due to be released on August 22.

It seems to me that a movie based on radio bootlegging would generate a negative attitude towards amateur radio. Any comments?

A while ago, there was a discussion on rec.ham-radio regarding a growling interference that sounded like power line noise. The people who were discussing it mentioned it was about 20-30 KHZ wide and occured every 50-60KHZ across the band.

I sympathised quite a bit because I have had similar interference at my location, all across the HF spectrum.

A few days ago it was tracked down to be a touch-lamp (the kind you touch to turn on and off) in a house about 3 blocks away. Once the lamp was unplugged the noise stopped.

Hope this info is useful to other that had the similar noise.

I've seen a book listed in the ads in CQ magazine for a book on "Modifications to Amateur Radio Equipment". It appears to cover many of the mods for current equipment relating to expanding receiver and transmitter coverage of many (most) current radios. The ads state the book is about 200 pages, so it sounds like quite a bit could be covered.

Has anyone purchased this book, and if so, what is their opinion of it?

I have several questions on IC 24AT operations and capabilities, as well as on the associated accesories.

* Can the BP-90 (6 - AA cells) be charged with either the wall charger supplied with the radio, or the BC-72?

* Can the BP-85 (high voltage pack) be charged with either the supplied wall charger, or is the BC-72 the only way to charge it?

* Does the CP-12 (cigar lighter plug and cord) essentially provide 12 V to the connector on the cord, or does the CP-12 do some internal regulation? Also, what kind of connector is on the end? Compatable with the IC 02AT?

* Will the cross-band repeater mode permit simplex to duplex crossbanding, or is it limited to simplex to simplex?

* Has anyone measured the sensitivity out of band?

* How high will the PLL lock...ie, what's the upper limit for receive?

* Potential ugliness aside, is there an after market adapter which will adapt battery packs like the BP7 to the IC24?

* Is the BC-35 usable or modifiable for use in recharging the new packs?

* What are the possible ways of recharging a BP-85? BP-90?

* Any other comments on pros, cons, limitations or quirks?

Thanks much.

I am another victim of touch lamp RFI which wipes out signals weaker than S9 on 40, 20, and 15 meters. The lamp is located about a block away from my QTH. I borrowed the lamp last weekend and installed a "Pi" line filter consisting of 2 .01 uF capacitors and 2 100 uH chokes. I mounted the filter in the lamp base, in series with the AC line input. Unfortunately, the noise level was only attenuated by about one S-unit. My next experiment will be to install a capacitor directly across the Triac in the controller. Has anyone on the net successfully eliminated touch lamp RFI? By the way, the lamp controller was made in Taiwan, and has no RFI suppression components. A local fake antique shop owner told me that he has sold "hundreds" of these lamps, so this may become a serious RFI problem that needs an urgent solution.

> for radio control boats or aircraft? I know there are
> some freqs like 50.1 50.2 etc that we can use. Can
> manufacturers of this equipment be easily found?

Whoa there..... The lower end of six is the province of the DXers.
For example 50.110 and 50.125 are SSB calling frequencies, and CW/SSB is
common up to at least 50.200 +.
If you value the health of your model, you will choose more conventional
model-control frequencies on 6. For example the ARRL Bandplan now talks
about 50.8 -51.0. Traditionally model control has been up in the 53 + region.

I can't suggest specific equipment, sorry.

Bob W3OTC   50 states, 67 countries, 6 continents on SIX

Are there any frequencies in the Bandplan or by common convention for
6 meter packet?

My tnc is far better at waiting for those band openings than I am.

I've worked 50 countries on Oscar 13. Most of those countries are outside
North America. Included are many that are not especially known for
high per-capita income... Zaire, Haite, USSR, East Germany, Gabon, India,
Czechoslovakia, Romania... By today's standards, my 50 contries is no
big deal. Quite a few folks have satellite-DXCC, having worked 100 countries.
So... there are people out there, widely distributed around the world, who

are active on the satellites.

>Anyway, I guess that technology for technology's sake is a good
>thing, it's just a pity that ordinary hams with ordinary stations
>and income levels have to use the Russian satellites if they
>want to use satellites at all....

Not correct. My first contacts on a satellite (SSB mode on Fuji Oscar 12) were made with the following... Vertical antennas, an old 2m ssb rig that i borrowed, and my HF rig hooked to a 435MHz transverter that i bought at a swapmeet for $150. I agree with your basic concern that radios, preamps, rotors, etc all cost too much, of course. You can buy radios used. That's a very common thing to do. You just don't need all the features of a newfangled $1400 radio! You can get by, at least initially, without az/el rotors. Often, when i'm talking to a DX station, the operator will say, "hold on a minute, i gotta go outside and rotate the antennas!". Satellite antennas can be mounted near the ground, so you can literally just push 'em around by hand. Satellites such as Oscar-13, in molniya type orbits don't move very much during the "good" part of the orbit, so you don't have to do this very often. Some of the microsats are loud enough that you can use a simple vertical antenna with no rotator of any kind. Finally, the last expensive components... the antennas. Many foreign operators build their own. The various ARRL books are full of fairly complete plans. I'm not very good at mechanical construction, so I bought antennas, but i talk to lots of people who've built their own satellite antennas for 145 MHz & 435 MHz.

If you thought it took several thousand dollars to get on the satellites then i hope i've shattered that myth for you. If, on the other hand, you know how to build satellites that are easier to use, then by all means share your ideas. AMSAT (remember, it's a volunteer organization) needs you!

>What're the odds that the first ever geosynchronous AMSAT will need
>oodles of bucks for the "who cares, it's a neat technical hack!"
>esoteric up and downlinks....?
>

The odds are zero. The AMSAT Phase-IV project (study of possible geostationary satellite design) included a number of concepts to reduce the cost of a basic ground station. For example, because it's geostationary, you wouldn't need rotors. Because it was going to use higher powered transmitters, you woudn't need as sensitive a receiver on the ground, etc. Meanwhile, Phase-IV has been shelved because it was deemed to ambitious a project. Too costly to design and build.

Like others have said before, the PRO-34 is very prone to hear cellular phone transmissions on 800 MHz frequencies outside the cellular phone band.

However, there's another class of stations in this range that may sound, at first blush, like cellular phones.

Many SMR trunked repeaters in this band have a telephone interconnect facility, which lets customers make phone calls. They sound somewhat like ham radio autopatch on 2 meters because the mobile cannot talk and hear at the same time.

Both parties stay on the same frequency for the duration of the call.

| > VHF and above, WITH CURRENT EQUIPMENT AND TECHNIQUES. It's also
| > the most cost effective weak signal communications mode with any
| > equipment and/or technique.
|
| nor will I try. What's missing, though, and what started this whole mess, is
| some justification for *requiring a test of CW proficiency* in order to become
| a licensed amateur. That fact that CW is a useful technique under certain
| conditions does NOT, at least in my opinion, constitute such justification.
+---------------

My complaint exactly.

Novices can work packet on 220MHz and even can run digipeaters. So why
isn't packet covered on the Novice theory test? Why isn't there another
separate test on packet --- or, more precisely, why *is* there a test on CW
but not on packet?

It seems to me that CW's "exalted" position must be justified. It's not as if
we must use CW to worship the Great God of Electromagnetism, after all.

Wait! The Russian satellites are too expensive for me to use. I'd have to buy a HF rig and antenna to go along with my 2m,430,1269, and 2304 gear. :-) (Ok I DID just buy an HF rig, but then I'm a glutton for punishment.)

Seriously, the Microsats were designed to be used with relatively simple ground equipment. You don't have to have steerable antennas or high power. I used an IC211 and an IC402 bought at a hamfest for $100. After lightning blasted my station a while back, I did buy an expensive Kenwood 790A, but I'm not really happy with it. If anyone has an IC202 they'd like to part with, I'm interested. Antennas are simple homebrew J poles.

Oscars 10 and 13 do require steerable antennas and more power to

use effectively. I added a Mirage D1010N to my IC451 and used the
late lamented IC211 for receive. The antennas have evolved through
a series of commercial and homebrew models. They all worked to
varying degrees. Currently, I am using the high priced spread,
KLM, but cheaper antennas do work. I was sucessful with homebrew
helices wound from copper tubing over a PVC frame, mounted on a
ground level Radio Shack tripod and steered by hand. If you can
make 50 watts of RF on 435 (even an old Motorola dynamotor rig will do
this if you can stand the noise) and if you can receive 2 meter
sideband (say a converter to a HF receiver), then you should
be able to work 10 or 13. CW only of course. Yes pro-coders,
this no-coder can use the beep beep stuff too. :-) :-)

A state-of-the-art all mode all band satellite station can cost
a mint, but you can use the satellites for a whole lot less.
You can certainly work a Microsat or Oscar 13 for less than
the cost of a HF rig even if you start from scratch. I guess
it all depends on your priorities, if you simply must be on
the DXCC honor roll, then you won't have the funds to work
satellites. But, if VHF-UHF is your thing, you probably already
have enough equipment to work the birds.

>means a decrease in battery life.
>

I got chance to pop by The Shack last night and grab the LM386 they sell. It is in fact a LM386-1 - the exact same thing that is already in the PRO-34. But since I was in that 'modify mode' I decided to change the 2.2uF cap that is between pins 1 & 8 to a 10uF - in stock condition I measured .096 volts DC on the earphone jack with an earphone connected, volume at max and squelch fully open - after the cap change under the same conditions (even the same channel and frequency) it showed .102 Not a big difference at all, so next time im in at the local supply house I will be getting a LM386-3 to see how much audio I can get out of this puppy.

As for battery life, to my thinking if you do not exceed the same audio level of an unmodified radio - the battery life should be the same. This is in my case 90% of the time. There is however that 10% where having a bit extra headroom (audio power) would be a big plus ;-)

bezenek@plains.NoDak.edu (Todd M. Bezenek KO0N) writes:

> It seems to me that a movie based on radio bootlegging would
>generate a negative attitude towards amateur radio. Any comments?

How about a movie where the old ham can't wait for the national emergency so his pitiful station can save the day (Red Dawn)?

I am a ham and an ex-pirate, and I already have a negative attitude toward amateur radio. It seems no one can ask a technical question in this newsgroup (much less on the air) without getting a political answer:

Q: can I boost the power of my 49mc walkie talkie
A: THAT'S ILLEGAL. GO CRAWL INTO A HOLE.

I have a lot of equipment that I could use to break the law, some of which is ham gear, then there's my gun, my automobile.... I modified my IC 02-AT to get police channels? Anybody want to know why? Of course not. You're all sure I'm out there harassing the cops and I should be fined etc.

I did it because I worked in a two way shop, repairing radios FOR the police, and it was a very handy diagnostic tool.

Besides, suppose I just like to build radio circuits? My friend built a 60W AM broadcast transmitter just to see if he could do it. He has no equipment that works on 160, and no interest in talking to hams, but he built his circuit and he tested it with a dummy load. One time, the AM broadcaster he works for had an emergency, and his little tube-type transmitter kept them on the air! It was REALLY EXCITING.

Now I suppose I'll get flamed because my friend's transmitter would not meet FCC specifications for AM broadcasting.

So who is the real "radio amateur"? The guy who build circuits to learn about radio, or the guy who times out repeaters complaining that the

device could be used for illegal purposes, and denying assistence they
are probably not capable of providing anyhow?

You tell me --- who are the real "radio amateurs"?

When people ask me if I'm a ham, I say no, I just have a license.

David

SUBJECT: NEWS REPORT FROM KUWAIT
DATE REC'D: 12/8/0908Z
TO: ALL
FROM: KUWAIT

THANKS FOR THE RELAY THE MESSAGES...AND HERE IS A SMALL REPORT
FROM MY SELF YOU MAY TAKE AWAY MY NAME AND CALLSIGN ETC
YOU MAY SEND TOTHE W.P OR TO ANY DESTINATION YOU FIND IT GOOD.

IRAQIS AND SINCE MANY DAYS ARE COMING INTO KUWAIT AS
GROUPS OF HUNDREDS, AND THOUSANDS... THERE IS NO BORDER AND
THEY ARE NOW OVER 100 THOUSAND OR MAYBE MORE INTERING KUWAIT.

SOME OF THEM WITH BUSSES, AND OTHERS WITH CARS, BUSSES, AND LORRIES.

THEY TAKE EVERYTHING FROM THE SHOPS AND SHOPPING-CENTERS AND FILL INTO THE LORRIES AND GO BACK TO IRAQ. THEY BREAK EVERY SHOPE...ALL THE CARS IN THE WAREHOUSES OF THE BIG COMPANIES, SUCH AS NISSAN, TOYOTA, ALL JAPANESE, MERCEDEZ, GENERAL MOTORS ETC ETC... ALL ARE BEEING TAKEN AWAY TO IRAQ.. AND WHATEVER THEY CANNOT TAKE THEY BURN OR DAMAGE. THEY TAKE ALL THE PARTS... SPARES PARTS ACCESSORIES, AND WHATEVER WAS IN THE NATIONAL , TOSHIBA, MITSUBISHI, PHILLIPS ETC ETC BREAKING THE SHOWROOMS AND TAKING EVERY SINGLE AWAY. IT IS A COMPLETE CHAOS.... WE NOTHING TO DEFEND OURSELVES... WE HAVE NO WEAPONS TO DEFEND OUR HOUSES AND CHILDREN AND THERE IS NO POLICE NO ARM ... NOTHING TO BRING SOMETHING INTO CONTROL...IT IS AN ABSOLUTE QUIET-CHAOS IT IS A QUIET-CHAOS .. BECAUSE THERE IS NO RESIST... NO BODY CAN RESIST... AND THEY JUST COME AND TAKE WHATEVER THEY LIKE .... ALL THE FOOD STORES... BEEN STOLLEN....THEIR PUBLIC ARMIES (PUBLIC ARMY.... THEY CALL IT EL-JAYSH EL-SHAABI) HUNDRED THOUSAND OF THEM...FULLY ARMED WITH GUNS ANIT IS A VERY SAD SITUATION FURTHER MORE....SOME PEOPLE OF INSIDE KUWAIT .. BAD PEOPLE TAKE THE OPPORTUNITY TO WHATEVER HE LIKES... STEELING AND TAKING CARS BURNING ETC ETC... NO CONTROL NOBODY CAN TELL THEM ANYTHING... BECAUSE EVERYBODY WILL THINK THAT DAMAGES BEEN DONE BY IRAQIS ... AN IT IS NOT TRUE... THERE ARE MORE DAMAGE FROM PEOPLE INSIDE....FOR I AS I SAID THERE IS NO RULE NO GOVERNMENT NOTHING TO DEFENT THE PEOPLE OF KUWAIT INSIDE. FOOD AND ACCOMMODATIONS...NOW IN QUEUE YOU HAVE TO STAND IN LONG QUEUES IN FOUR LINES... 2 FOR MEN ANOTHER 2 FOR WOMEN.. AND FOR A   BUT THE SUPERMARKETS DO NOT SELL MORE THAN 10 KD FOR EACH FAMILY IN A DAY... THE FAMILIES HAVE NO CASH MONEY, THEY CAN OFFER THEIR CREDIT CARDS OR THE BANK-ACCOUNT-NUMBERS , AND CAN TAKE ABOUT 10 KDAND DISTRIBUTED IN THE SUPERMARKETS FOR PEOPLE TO READ.. BUT ALL THE KUWAITIS...JUST SPITTING ON THOSE PAPERS AND SQUEEZING THEM BY THEIR FEET... NOBODY LIKES TO READ ANYTHING ABOUT ALL WHAT IS WRITEN I DID NOT TRY TO TAKE ONE THEY CALL THE MUBARAK-ALKABEER HOSPITAL THEY GAVE IT THE NAME SORRY I FORGOT THE NAME NOW HI.. BUT CHANGING NAMES ANYWAY... E.O.F.

GA LOGOFF 73'S JULES DE XXX YYYYY
DURATION: 15 MINS.

I thought that that might be interesting to read. To the best of my typing ability, that is an exact replica of the message that I received.   By the way, KD is the Kuwaiti currency.

>I just want CW abolished as a requirement for a license.

Yes, but a case could be made that the greater percentage who learn CW before getting their license, the greater percentage who will use CW as an operating mode afterwards. Do you want to effect a change in the proportion of amateurs who operate CW?

In past years, the FCC probably considered it very useful to have operators who were trained to pick up CW maritime distress signals and such. Requiring CW for the amateur license created a body of such people for almost free. With satellite locators and such, I don't see as great a need to such operators anymore. But I see this as a bad thing for amateur radio, since the lower the perceived public benefit, the less government support we will probably get for our frequencies and privileges.

I haven't made up my mind on No-Code licensing yet. I don't think it will solve any of the "problems" in amateur radio, but it will change the nature of the hobby.

>
> I'm truly amazed at the number of Psychologists who are radio amateurs. However, there is no data to prove either of the above statements, other than appeal to the "Puritan Ethic". Given the number of LIDs on HF, ALL of whom have at least a General Class license, I find it hard to accept the argument on self-policing. ...

I'm no psychologist, but I can read psychology textbooks. Much experimental evidence exists that correlates the perceived effort a person has to expend to obtain something, with how highly they value that something after obtaining it.

Passing a written test alone requires much less effort than a written test plus an operating skill test. Should the goal be to make it easier to get into amateur radio, or to encourage leading edge technical skills over traditional operating skills? Would a more difficult written test that requires as much study time, on average, as it takes to learn code at 5 WPM be appropriate?

I value the very polite style of operating usually found in most amateur bands. The percentage of poor operators is significantly higher on CB. I've heard obscenities a few times on SSB and 2M, never in the novice CW subbands, and in well over 20% of CB transmissions I've monitored. IMHO a no-code license will somewhat increase the percentage of poor operators on the amateur bands. However, I don't know whether this "cost" will or will not outweigh the benefits of getting more good technical people involved in amateur radio.

I found several apparent images in an Icom 24AT with the receive capabilities opened up.

Displayed	Received same as:	difference
85.645	147.385	(61.74)
85.310	147.060	(61.75)
88.00	TV channel 36 audio	
149.745	TV channel 36 audio	
201.250	146.940	(54.31)
201.500	147.060	(54.44)
206.875	TV channel 36 audio	

What frequency is channel 36 audio supposed to be transmitted on?
Could I have picked up a some sort of remote feed?

Other frequencies tested:

Air band: The Icom was not as sensitive as a Sony Air-8 air-band receiver, but still picked up several control towers and aircraft out to about a 20+ mile radius. An attic mounted discone was used for both radios for this comparison.

Middle of the 800 MHz range: the expected signals, about a dozen cells could be heard.

In the FM broadcast band I could hear a few strong local stations (106.5 MHz comes to mind), but only when very quiet music passages were being playing.

BTW using the rubber duck antenna that comes with the 24AT is like transmitting into an attenuator. I get signal reports up to 3 S-units higher with either a 19" metal whip or a Yeasu dual band rubber duck.

What is recommended for HF transmitting when a ground isn't available? Example situations: multi story apartments, hotel rooms, roof top stations, mountain top portable stations, or air mobile (aircraft operators permission, of course :-).

Do balanced antennas, balanced feedlines, or various matching networks help keep RF off the radio case? Are counterpoises effective and do they radiate?

Also, how can base fed vertical antennas without an earth ground be decoupled from the feedline?

Thanks,

```

A recent posting mentioned a bill being run through California regarding the monitoring of cordless phones. The author stated that allscanners, sw receivers and UHF TELEVISIONS TUNING THROUGH CHANNEL 83 can receive cordless phones. Can someone please explain this to me???

Last I checked, the old cordless phone operated on 1.7/49 MHz and the new ones are on 46/49MHz. Now I'm not sure exactly where the UHF channels are all at, however I do know it starts up around 470 MHz or so and channel 2, which is the lowest TV channel I know of starts at about 56 MHz and they all go up from there. SO how do you get cordless phones on UHF TV?? Is there a new set of frequencies for cordless phones?? I know I'm not always on top of new developments, so PLEASE fill me in. Inquiring minds and all that.

Thanks
73,
Michael

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

How would YOU feel if someone required that you learn some other method of
communication in order to earn the privilege of communicating in Morse Code
on the Amateur spectrum?

> Here are the issues of interest to me and my comments:
>

> 1. Reasons for keeping CW.

Tell me... when you say "...keeping CW" do you mean:
1. Keep CW as one of the modes hams may use
2. Keep the CW exam as a requirement for any amateur privilege

You did NOT say "exam". To me that means you probably meant #1, but maybe I am wrong and you meant #2. I do suspect many people will think that you meant #2 so maybe you could clarify.

> a. Its relatively small bandwidth makes good use of the limited amateur spectrum, thus enabling many QSOs to take place over a given frequency range. This feature is something that will become increasingly a factor in the near future as demands are made not only from within amateur radio but from without for more frequency spectrum.

CW does have a relatively small bandwidth. This is partly because it also has a slow "data rate". Voice, however, while having a very high data rate and also a very high data per bandwidth rate, suffers from the fact that most of the data itself is useless. This is not a comment on what we hear on the frequencies, but rather a description of the characteristic of the human voice. Arguments can also be made about WHAT is said with voice. So one possible reason to use CW is:

There is less opportunity, and fewer operators, "jawing off" in CW.

> b. A message has a better chance of getting through under conditions of weak signal, interference, or noise.

CW's ability to get through noise is NOT because it has a narrow bandwidth, but actually because it has a WIDER bandwidth. We just think the reason is the narrow bandwidth because we generally see CW as narrow and packet or RTTY (and other modes) as wider. The ability for ANY signal to overcome noise is strictly a function of its level of redundancy. Redundancy can take many forms. FM is redundant because the information is sent in many sidebands. CW is redundant because the carrier remains on for relatively lengthy time periods. Even raising the power is a real form of redundancy. When QRO can only barely get through, QRP will be unable to.

Slow packet down to the same rate, and it will be able to as well. But is this an efficient use of the spectrum if the number of messages you can get through is very low? Think in terms of "words per minute per bandwidth per watts". Bandwidth is "cycles per second" so you have two time components that cancel out. Now you have "words per cycle per watts".

Given extreme conditions, such as a ship beached on an unknown island in the south pacific in the middle of a storm, CW might be able to make it through when other modes might not. The reason for this is the fact that it is a SLOW mode. When conditions get tough for even CW, don't you find yourself going QRS?

> c. International communication is straightforward and simple with

> predefined Q signals and other accepted amateur abbreviations.

You can, and I do, use these Q signals in voice. CW does not have any exclusivity to abbreviations.

> d. Its simplicity enables any amateur, who is assumed to have a fundamental knowledge of the art and science of radio communication, to signal in the event of emergency when this most basic form of communication is required. The most appropriate instances are when one is isolated during an accident or natural unnatural disaster and other means of communication either do not work for reasons of equipment failure or because of inadequate signal levels at the receiver.

Unfortunately, we hams are losing this knowledge of the art and science.

> e. CW is a skill that is achieved through the expense of effort. My personal belief is that something is appreciated more if one works toward a goal and achieves it as a result of his own ability and work. Something has little value if it is given outright with no corresponding expense of energy on the part of the recipient. In the present case, that something is the privilege to operate an amateur radio station.

I believe quite differently than you do. My belief system is based on a simple economic model. For anything I might get, it costs me something to get it, and it benefits me in some way. While I usually do not actually quantify my individual decisions, I do think of them in that way.

When I choose to buy something in a store, I think in terms of the cost to me to buy it (which is MORE than just money... it includes the need I have for my pocket money for food if I am hungry, the effort to carry it home, etc.) vs. the benefits I will receive from it. If I believe the benefits will exceed the costs, I will buy it. I might have wrong information and in fact have many times bought things that turned out to have less benefit than their cost. I then decided to sell them because the benefit of keeping them was less than the benefit of the money I could get by selling them.

I decided to get into ham radio because the perceived benefit exceeded the perceived costs. I have understood correctly what ham radio was for many years. The perceived benefits were accurately understood. The costs, on the other hand, changed. I perceived the costs to be high because I was running into poor methods of teaching code. I finally found a ham radio class the was teaching the code in such a way that it was easy for me. The Morse Code turned out to be quite easy (as was the written exam, but I knew that already).

So in fact I got into ham radio because for me it became EASY to do relative to the benefits. I will remain active as a ham as long as the benefits of ham radio exceed the benefits of spending my time doing something else.

To bring my point to its zenith, my appreciation of ham radio is strictly based on the BENEFITS it gives me, and absolutely unrelated to the work involved in getting into it. That work, what little there was, is past me now and I cannot recover it.

> f. CW is a continuation of a form of communication that originated more than one hundred years ago, if not sooner. Today, it not only is still a proven fundamental means of communication, but it is an art form and a skill to achieve and to improve upon. It provides the user the opportunity to set several goals for desired levels of proficiency.

There are two parts to this. Your history lesson is probably accurate. Then you switch to something about proficiency levels. Are you meaning just proficiency levels in operating Morse Code? What about setting goals for proficiency levels on other areas? There are many of them, of course.

> g. CW permits one to have a conversation with another at a speed which is comfortable to the operator, and as a result, permits the operator to organize his thoughts so that a coherent and continuous exchange can take place. That is, there can be less pauses than are found in voice communication.

The pauses often heard in voice communication take place primarily in long winded transmissions. Keep your transmissions short and you won't have these problems.

> Ham Radio Dealer
>
> In connection with the comment above, my dealer was R and L Electronics of Hamilton, Ohio. They were courteous and handled my needs promptly. I was entirely satisfied with the repair that they made to my TS-940s.

I have found them to be this way as well. I have also found other dealers to be this way.

> Overall view of amateur radio.
>
> It is funny that in reading the news articles of several amateurs, that some things seem to remain the same: the discussions of the applicability of CW and other modes of communication, the status of particular classes of licensees, the perceived importance of the kind of call sign one uses, the mystery of electromagnetic radiation and its application, the threats to amateur radio from within and from outside. These issues, among many others, are not new to amateur radio, because I was exposed to them when I started, and I suspect that older amateurs share a similar point of view with respect to their memories of the past.

Things never change; we are all different kinds of people. If we were all alike, it would be no fun at all.

> We should not lose sight of what amateur radio is about, however. In its most basic terms amateur radio is for experimentation, education,

> public service, international good will, and, certainly not the least,
> amateur radio is for fun. We have something which contains so much value
> and so much potential for good for others. I believe it is something we
> should treasure and preserve. I feel we can best do that by treating others
> with respect, courtesy, calmness, and reason. There are certainly
> abuses within amateur radio and issues of use of spectrum by outside
> interests. These issues can be met in an organized way and dealt with.
> If, however, the amateur community as a whole cares little about its
> integrity, it will ultimately be splintered, and its effectiveness
> as a constructive resource for the community will be lost.

I believe most of the posters here, as well as most hams, have the best
interests of ham radio in their mind. However the differences are most
likey a result of the basic differences as individuals.

> I have had many QSOs in my amateur radio experience, and from this
> I believe that most amateurs are good operators and care about their
> avocation. There certainly is hope for amateur radio, and that
> hope comes from the majority of amateurs who support the fundamental
> principles of amateur radio.

Now if we can only agree upon just what those fundamental principles are.
I suspect we never will. The "we" is the whole of the ham population.

> P. S. If anyone would like to discuss any of the topics further with
>   me, or anything else, I'm on CW most evenings on 80, 40, or
>   20 meters depending on propagation conditions. Look on 3.500
>   to 3.525, 3.677, 7.000 to 7.025, and 14.000 to 14.025 MHz. I
>   spend most of my time listening for DX so you may not hear me.
>   Call me on frequency or make a sked through email or better yet,
>   send me a message through the National Traffic System the old CW
>   way.

It looks like we are sufficiently different in operating that we probably
won't communicate by ham radio very soon. I primarily use the VHF and UHF
bands using voice modes, and expect to be going into packet radio and ATV
soon. I do notice most of the above frequencies are in the Extra class
only subbands. Is this intentional? I would respect your desire to limit
your operation to others who have higher speed code skills, as the slower
code speeds can quickly get boring. Not much gets said when you can only
say 5 words every minute. I would like to make the suggestion that you
find time sometimes to visit the Novice subbands, and help someone with
practice in their code. You would have to tolerate their slow and poor
code, but I suspect you are good operator and they could use some good
examples, as well as the practice.

Since we are tossing out ideas of license class structures, I'll toss
out mine as well:

```
     .   .    .    .   .
    VHF / UHF  track            HF / code  track

          |                            |
          |                            |
          V                            V

    COMMUNICATOR                NOVICE                <----  beginner /
    basic written exam          basic written exam           entry level
          .                     HF written element
          .                     5 WPM CW exam
    limited privs > 50 Mhz      COMM+ limited HF privs

    TECHNICIAN                  GENERAL
    advanced written exam       advanced written exam  <----  primary
          .                     HF written element            classes
          .                     5 WPM CW exam
    all privs > 50 Mhz          TECH+ most HF privs
```

The upgrade paths are:

```
        start
          |
          V
     COMMUNICATOR  --->  NOVICE
          |                |
          |                |
          V                V
     TECHNICIAN  ---->  GENERAL
                           |
                           |
                           V
                          ???
```

There is no path from Novice to Tech in this scheme because if you can pass the combination of exam elements for Novice and Tech you have passed all the ones for General. You can of course skip any number of steps you want to from the starting point.

More privilege details:

Novice:
    current novice privs at 200 watts max.
    plus:
Communicator:
    25-50 watts max on VHF/UHF
    5-10 watts max on SHF/EHF
    Not control op of repeater/beacon/auxiliary

The "???" is a place where you can still have Advanced and Extra classes. Many hams now holding these would not want to see the system too radically simplified.

But as much evidence exists to the contrary as well. In particular this characteristic differs from one individual to the next.

> Passing a written test alone requires much less effort than a written
> test plus an operating skill test. Should the goal be to make it easier
> to get into amateur radio, or to encourage leading edge technical skills

> over traditional operating skills? Would a more difficult written test
> that requires as much study time, on average, as it takes to learn code
> at 5 WPM be appropriate?

Again, things differ between individuals. Some people find the code test harder, some find the written test harder, some find both easy, and some find both hard.

A more difficult test for the sake of being more difficult is out of place. Such a test serves no purpose but to haze people. The test to earn the privilege of being a ham radio operator should test for what knowledge and skills are required to be able to share a radio spectrum. It doesn't need to be intentionally hard. Some will find it hard and some will find it easy no matter what you come up with.

> I value the very polite style of operating usually found in most amateur

> involved in amateur radio.

CW as an operating mode tends to discourage bad operating practices. It's time we thrust off that crutch and start to "heal" the Amateur Radio service directly. Sure, there are some bad operators, but this problem can be dealt with. But it is by no means at the crisis level either.

>   It has been said that the reason for making a no code license

> is to attract high quality (tech) people into the hobby. I think it will have exactly the opposite effect. One of the things that has kept the hobby in reasonably good shape has been that the people who work for their ticket, ie. learn code, are more likely to be self policing than someone who is given a ticket. (Yes, GIVEN! I don't care how many technical questions you put on a test, any moron can memorize a question pool) Usually people who are "challenged" by a problem, like learning CW, and WORK to overcome (solve) that problem, carry that philosophy in life. It's those people, the ones who enjoy a good "challenge", like dealing with packet throughput or refining DSP or spread spectrum, are the people that we NEED in this hobby. (did Marconi know CW?)

First of all, let's get something straight here once and for all:

Learning Morse Code is, for the vast majority, EASY!

Morse is NOT a challenge, for the most part it is just hazing.

So what value is there in the "work" involved in it? It took me a grand total of 6 hours of study time to learn Morse Code. Does that make me feel my license is somehow more valuable? DEFINITELY NOT! In fact, the continued existance of the Morse Code requirement makes my license seem LESS valuable.

We hear this argument quite often. This is the one about the "work" ethic and such. Perhaps some people do value someone based on how much it costs to get. I don't. I value something on what I continue to get out of it.

> But it's too late now. We ran our big mouth and said we wanted a no-code license. The FCC is going to give us one like-it-or-not. They have been pressured on this subject for years. Now that "we" have expressed a desire to have a codless license, we'll get one.

Good! It's about time. I'm relieved to know all this effort has paid off. Maybe I might even VALUE IT for all the WORK I put in it :-)

> A couple of things may have been overlooked (or have long since died) that concern me:
>
> The FCC stated that they would not implement an additional class of license. It would require resources that they don't have. So, we opened our big mouths again and said that four-letter word "restructure". Ohhhh noooooooooooooooo!

They have the capacity for 6 classes because the present computer system was put together under the impression of an impending Communicator class in a prior proposal.

> The FCC also said that they would not issue calls that labeled these VHF/UHF codeless newcomers as codeless newcomers. It would require re-programming, effort, willingness, or something like that. Again, resources that they don't have. Now I guess we will have a large pool of codeless VHF/UHF apliance operators who have calls that are no

> different from the guys on HF. hmmm howz anybody gonna know??

How do you know NOW?? I am KA9WGN, and without looking it up you just
cannot tell. Am I a Novice? Tech? Advanced? You tell me.

> than "fellow amateurs" (awwww, do I have to??) then they will have no
> more respect for the hobby than the folks on 11 meters (or 20 or 80).

If you convince them of the benefits they can enjoy with their license,
maybe they will respect it.

>   My problem now is that I still get nervous as a novice when I
> operate CW. I have got to get over my fear of working CW before the
> no-coders come.

If you operate HF, you won't see much difference. The "no-coders"
may be coming, but they are coming to at least above 30 Mhz and maybe
even above 220 Mhz. So if you are into code on HF, you won't see much
effect from "no code" except maybe a slight reduction on the overcrowding
down there.

In article <9008190236.AA22820@ucsd.edu> lwrclmr@SACEMNET.AF.MIL ("LWRCLMR")

writes:

>A recent posting mentioned a bill being run through California regarding the
>monitoring of cordless phones. The author stated that allscanners, sw
>receivers and UHF TELEVISIONS TUNING THROUGH CHANNEL 83 can receive cordless
>phones. Can someone please explain this to me???

Somebody's mixing apples and oranges here.

Some shortwave radios can tune to the 1700 KHz band where the older cordless phones can be found, but "shortwave" receivers can't receive the VHF 46/49 MHz bands where most cordless phones operate, so they are of limited use.

Most scanners can be used on the VHF cordless phone frequencies. This is true.

UHF TV's capable of tuning up to channel 83 have no use in receiving cordless phone conversations. However, they can be used with limited success in listening to CELLULAR phones, which are in the 800 MHz band (870.03-889.98 for cellular base frequencies). Modern digital TV sets wouldn't work, but older ones with a fine-tuning control may work.
I haven't tried this myself.

Here are the cordless phone frequencies, if anybody needs them.

Channel	Base	Handset
1	46.61	49.67
2	46.63	49.845
3	46.67	49.86
4	46.71	49.77
5	46.73	49.875
6	46.77	49.83
7	46.83	49.89
8	46.87	49.93
9	46.93	49.99
10	46.97	49.97

49.83 is also commonly used for room monitors (aka baby monitors).

The BP-90 as supplied cannot be recharged, as far as I can tell. There's an adapter called an AD-14 that allows you to use the BP90 in the BC-72, but what it's function is I've not been able to find out. I called ICOM technical support, couldn't remember the adapter number at that time, and the person knew nothing about any such item. I'll call again with the number AD-14 in hand and see what they say.

The BC-74, which is what I think comes with the 24AT will charge the BP-85.   The CP-12 does no internal regulation. There's also a OPC-254 which is a DC power cord without the filter, cigarette lighter plug, but has two fuses, and is $4.50. It's a very small coaxial power plug, and I don't believe it's compatible with the 02AT since it's not the same as my IC32AT.

The BC35 cannot be used to charge the S series batteries to my knowledge, however the BC72 can run with 13.8VDC input.

The BP-85 can be charged by the BC-72, BC-74, CP-12, or the OPC-254, according to the manual.

The above information is from having an R1 in my hand which uses the same batteries, etc. as the IC24.

RTTY DX Notes 1of3 8/17/90

RTTY DX Notes for weekending 17th August 1990
BID: $RTDX0817
Part 1 of 3.

With the problems in the Middle East, one could be expected to assume that communications with that area would be closed off, but such does not appear to be the case. Several stations have been noted passing traffic (from both sides of the fence). It just goes to show that you cannot always trust these amateurs. Some of the information has been good and some bad, as one would expect under the circumstances.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JA1BLV, OD5NG, TG9VT, UT5RP, W2JGR, W0LKS and the Tri-State DX Association VHF packet cluster, and to those not named who also sent some interesting news.

RTTY DX Notes 3of3 8/17/90

RTTY DX Notes for weekending 17th August 1990
BID: $RTDX0819
Part 3 of 3.

QSL Information.

V51P will QSL via Box 9080, Windhoek, Namibia.

TU2BB has QSL manager of N2HOS.

9Y4SF has WA4JTG as his manager.

ZD9BV says to send his cards to W4FRU.

TL8TM says that F6FNU will do his QSL work for him.

FP5DX collects his cards from Box F-97500, St Piere et Miquelion, Via France.

7S4RY will QSL via SM4CMG.

RV4F/RT4UY says that his QSL address is Box 73 Kiev, 2522909 USSR. That postal code looks odd, but that is what he was sending, though I did see one report that says it is 252209. But the station was sending the original number.

JW7SP says to QSL via LA3T.

Notes of Interest.

The station listed as 9K2?? was deliberate to prevent any repercussions. Some mail is drifting out.

7S4RY is a special call celebrating the 20th anniversary of the SARTG RTTY Contest.

ZD9BV has been fairly active with a weak signal, which he hopes to improve when he has finished building his house and his new beam.

JA2NQD and JH1BNL will operate from Belau and Yap from September 13th to 19th. QSL to their home calls.

JG1NBD will operate from S79 Seychelles, September 13th to 17th.
JH1QDB will operate from Ogasawara (JD1) from September 23rd to 30th.

There seems to be a rumor around that there will be activity from TI9 from the 19th to the 24th of this month. But nothing has been heard on a solid basis as yet. Keep looking, it may happen.

Subj: B&W AP-10 antenna

I have had trouble making my B&W AP-10 apartment antenna work on 40 meters. I can tune the resonantor to 1:1 SWR with my KW SUPERmatch antenna tuner, but the antenna radiates like a dummy load. Eight feet of wire stretched across the room loaded with the antenna tuner works way better. Ideas.

>I will repeat my statement, with emphasis to make sure you understand:
>   Morse code is essential for most weak signal communications at
>   VHF and above, WITH CURRENT EQUIPMENT AND TECHNIQUES. It's also
>   the most cost effective weak signal communications mode with any
>   equipment and/or technique.

I don't think that anyone can reasonably argue with the above; I know I can't, nor will I try. What's missing, though, and what started this whole mess, is some justification for *requiring a test of CW proficiency* in order to become a licensed amateur. That fact that CW is a useful technique under certain conditions does NOT, at least in my opinion, constitute such justification. Especially in light of the facts that other modes shine equally bright in their own "special domains", and even CW may be used WITHOUT the operator having any particular proficiency, given modern technology. Which is the "better ham": the kid who can copy and send 25 WPM flawlessly into his store-bought rig, or the one who builds his own CW keyboard which can easily do 40 WPM? Can't decide between them? Neither can I - there are arguments either way. So why can one kid get the license, while the other one can't?

Hear hear!!! Three cheers for a return to the good ol' days of
only 3 license classes!!!

Ain't having just 3 classes a "tradition??"

Communicator, Novice (I always spelled it "Novoice"), and NewWaves.
The other way to look at it is that you get an HF endorsement!
The international rules DO NOT specify a code speed, only some
kind of demonstrated proficiency!!!!

>>> OK, so CW is "relevant" if you're going to operate in the "weak signal
>>> portion of the band." Now please explain why it is "relevant" to GETTING
>>> A LICENSE in the first place.
>
>>It is OBVIOUSLY RELEVANT for any license that grants privelege to
>>operate in the weak signal portion of the band. Hence, my comments to
>>the FCC regarding their ill advised no-code license, in which I urge

One way to look at things is that if CW was tested as rigorously as
the technical theory, there would be a few questions on the novice test
like :

The name of a system that uses long and short signals to encode
letters and numbers is:

a) Morse code
b) long-and-short (L&S) code
...

On the extra exam, you would get some questions like:

The morse translation for the letter Q is:
a) ._._.
...

It would of course be possible to miss all the CW questions and still
pass the test.

New idea (I think):

Element 4b is broad but not very deep.   Face it, figuring out
RC time constants isn't real deep stuff for the "cream of the crop"
license grade.

I think it would be in keeping with the idea of incentive upgrades to
have some broad test like 4b, plus an in depth specialty element.
Communications theory, digital, microwave, TV.... Pick any one, but you
have to know your stuff! 20 wpm code would be just one of the

choices. To keep ITU etc happy, we can require a lower code speed for those who choose a technical specialty, or drop it for vhf and up.

This would put things in a little better perspective: that CW is important, but it is only one mode, along with TV, packet, phone, and all the others.

With some adaption, this plan could accomodate all those non-code hi-tech gurus we are supposed to be alianating.

Some people said I was bitching about the extra exam because I hadn't taken or passed it. Now I can bitch from experience! I even know the secret handshake.

I, too, have had very good dealings with Ross Distributing of Preston, ID. I can similarly vouch for many of the hams in northern Utah; Ross supplies a lot of the radios there. His prices are normally quite good, Idaho has (had) no sales tax and when I got my TS430S (1985) they DID accept credit cards though they charge a fee (maybe 2%) to handle plastic. It all seemed quite fair to me; pay cash and get the best price otherwise don't complain if the retailer wants to keep his meager profit.

BTW Ross did us quite well at the WIMU hamfest, he was quite
cooperative in procuring the grand prize as well as providing
a good number of lesser prizes and grab-bag items.

Ross started out as a Western Auto franchise. When he got his
licence and wanted to get some equipment he discovered that
it was kind of difficult to do so in that area. He started
selling radios along side wrenches. After a few years the
radio buisness got so good that he gave up the WA franchise
and stuck with radios. I believe he DOES do scanner buisness.
All that Ross has become is a testament to a retailer who
still believes in giving the customer a fair shake and an
honest deal.

I am not connected with Ross Distributing but thought you
could use some personal experiance and observation of their
buisness.

Let me quote again from your original message:

> I have said this before and been shamelessly flamed. I will say it
> again, maybe people will learn to read and ponder not scan and emote.
> Imternationally, the only reason for amateur radio is self training

                       ^^^^

> and experimentation. In most of the world "H&W Traffic" etc is third

So, I think I interpreted your posting correctly. If you didn't _mean_
to say that emergency communication is not an internationally recognized
reason for amateur radio, fine, but that _is_ what you said.

> While I have your attention, let me say that I do not appreciate your
> snide comments to me on an open forum. Also I am somewhat annoyed that

Those who live by the sword...

> I should have to put up with impertinence from someone who is an
> employee of an organisation that I support with my fees.

I think this comes under the heading of attacking the messenger because
you don't like the message.

Regarding the point (there is a point, once we cut through the flaming),
I think the following material from the international regulations is
instructive. And yes, Julian, I got this material from the library
here. I sometimes use the librry for research so that I can disseminate
material to counter erroneous information posted on the net.

=====
International footnote 510 (From the Radio Regulations, Geneva 1982):

510--For the use of the bands allocated to the amateur service at 3.5 MHz,
7.0 MHz, 10.1 MHz, 14.0 MHz, 18.068 MHz, 21.0 MHz, 24.89 MHz and 144 MHz
in the event of natural disasters, see Resolution 640.

RESOLUTION No. 640

[TITLE] Relating to the International Use of Radiocommunications, in
the Event of Natural Disasters, in Frequency Bands Allocated to the
Amateur Service

The World Administrative Radio Conference, Geneva, 1979

[I won't quote the whole thing. It's about use of the amateur
bands by nonamateur communication providers in time of emergency.
But there are a couple of interesting sections...]

considering

a)   that in the event of natural diaster normal communication
systems are frequently overloaded, damaged, or completely disrupted;

...

e)   that under those circumstances the stations of the amateur service,
because of their widespread distribution and their demonstrated capacity
in such cases, can assist in meeting essential communication needs;

f)   the existence of national and regional amateur emergency networks
using frequencies throughout the bands allocated to the amateur service;

g)   that, in the event of a natural disaster, direct communication between
amateur stations and other stations might enable vital communications
to be carried out until normal communications are restored;

...

etc.

```

>With some adaption, this plan could accomodate all those non-code hi-tech gurus we are supposed to be alianating.
>
>

The following licensing idea came to mind after reading all of the notes in this file about the "Communicator Class" and "Incentive Licensing"

We could actually use our current system (already in place) and accomplish much of what everyone here has said or commented on.

The goal of this proposal is two fold:

1. Entry Level --- to get more young and non-technical people into this hobby.

2. Have those already in the hobby expand their knowledge of the various aspects of this hobby.

3. Make the administration of the licensing procedure less complicated. (not sure anything the government does is not complex)

Class	Elements	Options
Novice	2	CW 5 WPM
Technician	2,3a	Pick (1) from list below
General	2,3a,3b	" " " " "
Advanced	2,3a,3b,4a	" " " " "
Extra	2,3a,3b,4a,4b	" " " " "

Communicator 2,3a * (required)

Option List: (Aside from the code Exams these tests will be 25-30 multiple choice questions designed in the same manner as we have our tests designed today however the pool of questions should not be made public)

a. Packet
b. RTTY
c. CW 10 WPM
d. CW 15 WPM
e. CW 20 WPM
f. Microwave
g. Emergency Service / Operations
h. Net Operations / Control
i. SSTV
j. Community Service
*k. UHF/VHF Operations
l. Satellite

(The above list is not all inclusive)

All current allocations and privs remain the same.

All current licenses are grandfathered.

If the the current proposed Communicator Class is approved the 5 WPM Code will be required for upgrade to Technician. (this assumes that the VHF/UHF privs are different for Technician and Communicator.

The desired results here are that:

1. Everyone can get into the hobby.
2. Those with higher levels of license have a good background into more of the hobbies aspects.
3. We can maintain the same licenses structure and have it mean more to be a certain class then it does now.

>device that can prevent a person from falling off a tower during
>climbing? ...

I always use vertical-caving equipment for safety when working on towers. I wear a nylon rock-climbing seat harness, and attach myself to the tower with a loop of 1" tubular nylon webbing and a carabiner (snap link). The nylon harness is very comfortable, and allows the user to sit down and rest anytime. Nylon is less abrasion-resistant than leather, but is stronger and does not rot.

Tower climbers' traditional leather belts are obsolete by climbing/caving/vertical-rescue standards. It is important that the harness pass under the hips, forming a seat. An injured or unconscious person hanging by a waist belt has short life expectancy: The belt moves upward, constricts the chest, and may cause suffocation.

Safety devices for tower climbing which slide upward and lock are available but expensive, usually requiring that a track be permanently attached to the tower. I use 7/16" nylon "cave rope" and _Jumar_

Ascenders or variants: The Swiss-made Jumar clips securely onto the rope, and slides upward with little friction. A toothed cam grips the rope to prevent downward movement. In electrical terms, it is a rope rectifier. :-)

A pair of Jumars are normally used to climb rope; there are many configurations of ascenders and harnesses (see reference). The legs, which are much stronger than the arms, do the work of climbing. The climber can stop and rest at any time, hands free. An experienced person of average strength can climb 1000 feet of free-hanging rope in less than one hour.

For tower work, I like to climb the tower itself and use a Jumar safety on the rope (which is installed by pulling over a pully at the top of the tower by a permanently-installed nylon string). Another Jumar provides safety when hauling loads up the tower, so they can't fall if someone drops the rope.

You need a rope to pull up antennas, etc. when working on towers anyway, so may as well get a good one and use it for safety too. Do not trust your life to a rope not made especially for climbing (see reference).

Climbing back down a tower is work; it's easier, safer, faster and more fun to rappel down the rope. I use a "rappel rack" variable-friction device. A heavy object (or injured person) can be lowered from a tower very easily by using a fixed rappel device to control descent.

ALWAYS wear a (nonconductive) hard hat with chin strap when doing tower work, whether you are on the tower or providing ground support.

The abovementioned equipment and techniques work reliably in extremely nasty environments, in normal and rescue situations. Adapting them to tower-climbing is easy, but read about it first, and consult someone experienced: Subtle nuances like knots (*) are vital to safety.

(*) As recently mentioned in rec.ham-radio, the Boy Scouts no longer teach Morse code. Do they still teach knots? Most of the knots in the BS Handbook are utterly worthless and dangerous in the context of climbing.

Todd Enders says, among other things:

> As far as protecting the weak signal portions of the bands from the communicators, remember, we have CW only subbands on most of the vhf/uhf bands. IF YOU DON'T LIKE PHONE OPS WORKING WEAK SIGNAL, STAY IN THE CW SUBBANDS!!! I seriously doubt that all that many communicators are going to be interested in weak signal anyhow. I think they'll be too busy yaking on a repeater or working packet to care much about us folk who dig the weak ones out of the noise (whether ssb or cw!!!)!

I know of no FCC-mandated CW-only portion of any UHF ham band.

MY concern, and that of some others, is that the no-code folks will be doing their FM yacking and packeting in the band segments now used for Weak Signal SSB, etc. (esp. 50.1-50.5 and 144.1-144.5). There is no FCC-promulgated word that gives a hint that FM rag-chewing is inappropriate in these portions of the bands. ARRL band-plans are generally a mystery to many experienced hams; there is no reason to expect that the newcomers will hear of them, or follow them.   Please read W3XO's comments on 90-55, which I posted last night.
W3XO does the "World Above 50 MHz" monthly column in QST.
I have not seen W1EJ's comments, but I understand that Tom is also asking for the FCC to establish NARROW-BAND-EMISSION subbands on vhf-and-up. W1EJ is on the ARRL VHF / UHF Advisory Committee (which does the band plans) and was its chairman last year (and not too happy with the ARRL hierarchy). My understanding is that W3XO and W1EJ do NOT intend that no-coders be restricted from these segments.

Bob Myers, KC0EW, writes:

<<Say I'm a RTTY fanatic, and I'm fed up
with hunt-and-peck artists clogging up the airwaves, leaving no room for me
and my buddies to exchange 60 WPM QSOs. Now, using your reasoning, why
shouldn't I ask the FCC to require a typing proficiency test of all applicants?
After all, they'll have the privileges to operate RIGHT ALONGSIDE OF ME!!!
HORRORS!>>

Hear, hear!

I would add that a typing test is certainly more relevant to 1990
communicationsthan is manually-encoded, manually-decoded morse code.

The time has come for us to stop requiring proficiency in one mode. No-code
would not have made sense in 1950. It makes lots of sense today.

I would be indifferent towards adding a technically-qualified new ham who knew
code and a technically-qualified new ham who knew digital techniques. The
odds of our highly-popular yack-yack bands getting any more or less congested
would be the same in either case. But the odds of a new technological
development would be arguably better by letting in the digital person.

Attachment to morse code is fundamentally an emotional issue. Everyone has
a right to his or her opinions, and there's nothing wrong with human emotions.
But we should all admit to ourselves exactly why we believe the way we do.

Bottom line: everyone had a chance to comment by August 6 and try to
convince the Commission to see things his or her way. Now it's up to the
Commission to make a decision. I'll be glad when this is settled. (But I'll
bet that, if a no-code license is created, we'll still be hearing complaints
about it a quarter-century from now, just like incentive licensing... those
emotions sure last a long time!)

It looks to me as if the Germans want the R1 to be a ham-bands rig.
The French restriction just looks non-sensical to me.

Has anyone any information, anecdotal or otherwise, about carrying a
radio with "prohibited frequency coverage" while traveling.
For instance, apparently carrying my R1 in a car in NJ is illegal
(maybe just having it turned on in a car is illegal).
What about other places?
What about the issue of the appearance of the R1 (sure looks like a
HT to me), or other scanners?

I have an R1 on indefinite loan, and I think the user interface leaves
something to be desired. Maybe I'll get used to it.

Well as I said in a previous post, if you want to change the discussion
from cramming broadcast TV into adjacent channels to dropping public
safety channels into the broadcast forbidden channels, then you will get
little argument from me. The additional interference to viewers would be
minimal except for those few who lived next to the police base stations.
I consider this a reasonable tradeoff. I do consider unreasonable causing
interference to thousands of viewers by placing broadcast TV signals on

adjacent channels. What has actually happened in LA is that the LA county sheriff's office has taken over TV channel 14 AND the FCC has declared NO new TV licenses will be granted on TV channels 15, 16, or 17 within 75 miles of LA county TO PROTECT THE SHERIFF'S DEPT. Since public safety radios are essentially the same radios as amateurs use, I mentioned the amateur coordination example. I feel the FCC's action was excessively conservative. Many broadcasters have become vehement about protecting their spectrum following this precedent setting action. This has become primarily a political problem rather than a technical one. If the FCC reverses itself, many broadcasters will once again be receptive to public safety dropins.

On that subject:

My house was burgled earlier on in the year, amongst other things stolen was my FT23 VHF handheld. I gave the serial number to the police and expected to hear nothing from them again.

About 6 weeks ago I got a call from the police to say that my radio had been recovered after a high speed persuit that led to the arrest of a bank robber. It appears that he was using the radio to listen to the

police frequencies. (I had pulled the strap to enable the extended frequency coverage.)
     Well, the FBI have my radio now, and it will be used as evidence in his trial. I was told that I might expect it back in about 8 months!

>when hiking. The idea is that I like to go hiking, mountain climbing,
>and such but I tend to be a lot slower than the people I usually go

I am an experienced hill-walker and I teach and have always been taught that the most important aspect of hill walking is the concept of going in a group (unless your on your own:-). This group has a leader and EVERYONE STICKS TOGETHER unless a formal decision is made to split the group. Just letting someone fall behind is BAD LEADERSHIP.

>with. To make matters worse they usually are the ones that know where
>we're going. This has made for some very interesting and memorable

If your 'leader' knows you cannot navigate, he obviously cant have any consideration for YOUR safety if he is prepared to "loose you".

Your cheapest and most reliable solution is LEARN TO NAVIGATE
books should start about 10 dollars, and once learned it is a skill
that brings great satisfaction in its own right.

By all means carry HT's on the hill (I always do) but they are NOT
a substitute for good mountain practice and procedure.

>>> OK, so CW is "relevant" if you're going to operate in the "weak signal
>>> portion of the band." Now please explain why it is "relevant" to GETTING
>>> A LICENSE in the first place.
>
>>It is OBVIOUSLY RELEVANT for any license that grants privelege to
>>operate in the weak signal portion of the band. Hence, my comments to
>>the FCC regarding their ill advised no-code license, in which I urge

One way to look at things is that if CW was tested as rigorously as the technical theory, there would be a few questions on the novice test like :

The name of a system that uses long and short signals to encode letters and numbers is:

a) Morse code
b) long-and-short (L&S) code
...

On the extra exam, you would get some questions like:

The morse translation for the letter Q is:
a) ._._.
...

It would of course be possible to miss all the CW questions and still pass the test.

New idea (I think):

Element 4b is broad but not very deep.   Face it, figuring out RC time constants isn't real deep stuff for the "cream of the crop" license grade.

I think it would be in keeping with the idea of incentive upgrades to have some broad test like 4b, plus an in depth specialty element. Communications theory, digital, microwave, TV.... Pick any one, but you have to know your stuff! 20 wpm code would be just one of the choices. To keep ITU etc happy, we can require a lower code speed for those who choose a technical specialty, or drop it for vhf and up.

This would put things in a little better perspective: that CW is important, but it is only one mode, along with TV, packet, phone, and all the others.

With some adaption, this plan could accomodate all those non-code hi-tech gurus we are supposed to be alianating.

Some people said I was bitching about the extra exam because I hadn't taken or passed it. Now I can bitch from experience! I even know the secret handshake.

Um, what is it about this magical talisman called CW that keeps them FM yackers away from those precious weak signal slivers? ;-)

Seriously, given the interest level in weak signal work, do you really need more than 50 KHz in any band?

> As far as protecting the weak signal portions of the bands from the
> communicators, remember, we have CW only subbands on most of the vhf/uhf
> bands.

This is not true. We only have CW only subbands on 6m and 2m. In addition, they are totally ineffective at providing the kind of protection the weak signal operaters need. We need a few hundred kilohertz (on 2m) of guard space before there are any (relatively) wide-band signals like FM, because they raise the noise floor to unacceptably high levels. (Much more space is needed on the higher bands; the protected space needs to be allocated as a percentage of the operating frequency.) In addition, common practice is to use the calling frequency, +/- 100 kHz or so (depending upon crowding) for SSB _and_ CW. Also, pre-arranged contacts like meteor scatter are commonly arranged 200-300 kHz higher than the calling frequency. These people also need protection from the FM'ers. The _only_ time that the CW sidebands on 6m and 2m are used to any extent is when there is an auroral opening, and people like me are trying to get away from the _LIDS_ who refuse to use CW when it is absolutely required. The CW only subbands are not significantly used even during contests! This should not be construed to mean that CW is not used. CW is used extensively during contests, and indeed for most weak signal work. While we don't need CW only subbands on VHF and above, we need to make sure that all users of the weak signal portion of the bands are competent to use CW; 5 wpm does not constitute competence, but in my mind, 13 wpm is good enough.

"Gunn Diodes" aren't diodes!!! There is no pn junction!!! It's just a
chunk of GaAs, doped, with metalized contacts on both ends. You can use
it in either direction.

Just increase the voltage slowly, and don't ever put the voltage above
10 V or so if you have it oscillating. Make sure it's in a proper
cavity, with a proper load. (Placing the "diode" 1/4 lambda from the
open end of a piece of waveguide, with the other end open, is good
enough. You will be radiating, but I was only talking about protecting
the "diode".)

An observation -

The people of AMSAT are doing a great job of producing amateur
satellites. Their ever increasing complexity and abilities (the
satellite's, that is) are wonderful.

What a pity it is that most amateurs outside North America (and a good proportion within NA) can't afford the expensive additional hardware to use them.

(No, I don't want anyone telling me how they built/bought a complete 430MHz-light all mode rig for $5.95 or an az/el rotor for zilch out of a erector set - I'm thinking of of two things - money is a problem for most of us and outside of the first world it can be hard to even find the components even if you are a genius engineer....)

Anyway, I guess that technology for technology's sake is a good thing, it's just a pity that ordinary hams with ordinary stations and income levels have to use the Russian satellites if they want to use satellites at all....

What're the odds that the first ever geosynchronous AMSAT will need oodles of bucks for the "who cares, it's a neat technical hack!" esoteric up and downlinks....?

Nothing like it - space communications for hams, provided they can afford it......

....Halon system at the ready.....

>anyway, so may as well get a good one and use it for safety too.

>Do not trust your life to a rope not made especially for climbing

We use 1/2" *Static* Kernmantle rope for rescue. Unlike mountain climbing rope, it does not stretch.

>Climbing back down a tower is work; it's easier, safer, faster and
>more fun to rappel down the rope. I use a "rappel rack" variable-
>friction device. A heavy object (or injured person) can be lowered
>from a tower very easily by using a fixed rappel device to control
>descent.

The "rappel rack" has the unfortunate property that it can come completely off the rope if mishandled. It is good for VERY long descents, but not optimal for reasonable descents by not-too-experienced folks. We used a "Figure 8" with ears for rescue work. It can't come off the rope.

The same comment (can come off the rope) applies to the Jummar ascender.
A Gibbs ascender is safer for the less experienced.

>The abovementioned equipment and techniques work reliably in extremely
>nasty environments, in normal and rescue situations. Adapting them to
>tower-climbing is easy, but read about it first, and consult someone
>experienced: Subtle nuances like knots (*) are vital to safety.

Yes, I was surprised to find that knots used with nylon rope are entirely different from knots used with manila rope.

The way I see it, if you want to try to use phone during a weak auroral opening, that's your choice. I wouldn't consider somebody a lid because they prefer phone to code. I'm sure everyone agrees that code is a lot easier to decipher when aurora-ized as compared to phone. But I'm not sure I agree that using a mode that is not optimum for a particular band under particular conditions makes someone a poor operator. I have never been in a VHF contest here on the east coast where there is not enough room left for the CWers, even in the SSB subband. During auroral openings there is plenty of room for CW, even when mixed with those on SSB making normal tropo and LOS contacts.

I won't comment much on the code speed opinion. However, I'd much rather hear 10 WPM than 20 WPM during an auroral opening. It usually lasts long enough that the extra speed isn't necessary to complete the QSO and only makes tough copy even tougher.

My father has a Bearcat 250 scanner which has exhibited similar problems in the past. The main problem in his case has been the poor thermal design of the power supply regulators. TO-220 pass transistors are dissipating nearly 3 watts without any heatsinking what-so-ever. They get very hot!

It sounds like your problem may be an intermittant pass transistor. The pass transistors dissipate power as long as the scanner is plugged in. Unplugging the scanner would remove that power allowing the temperature to change and connection could be re-established.

The best thing to do would be to get it into the failed mode and measure the supply voltages. I don't have a schematic so I cannot give specific instructions as to where to measure.

If this turns out not to be your problem, while you are in there put some kind of heatsinks on the pass transistors. It could prevent future grief...

<Sorry about the repost, the first try of this got truncated before the list on the ArpaNet (Internet, whatever) side of things...>

Well, this certainly seems to address alot of of the issues surrounding cellular phone service. Kinda kills the objection about cells getting knocked out during natural disasters, doesn't it? As a friend of mine observed dryly, "if we have a natural disaster that makes it impossible to talk to an orbiting satellite, a 2 meter HT probably ain't gonna do much good either. We're talking serious atmospheric ionization here." :-).

Anyway...

In anticipation of the "it'll never work" discussion that I know (and the reader should know) is coming, I would like to present today's Top 10 List with apologies to Late Night with David Letterman....

From the Home Office in Scottsdale, Arizona....

Top 10 Reasons Why Hams Think Motorola's Iridium System Will Never Work...

10. Can't buy equipment from major Ham equipment manufacturers.
9. All those 900 numbers lead to undisciplined use of spectrum.
8. No allowance for use of CW in "high noise" environment.
7. Uses "evil" DSP techniques.
6. Not available in HeathKit version.
5. No exam required for upgrade.
4. Wrong numbers won't understand when you shout "CQ DX" at them.
3. I TOLD YOU this would happen when QST did away with "The World Above 900 MHz!"
2. It's yet another example of the "appliance operator" mentality.
1. Takes all the "challenge" out of global communications.

Flames to /dev/null please.

CEO summary:
A while back in this newsgroup, there was a question as to whether

Marlon Brando was a ham and if so was he still active. The general consensus was that the answer to both questions was, "yes."

Last night, on the TV news, there was a bit about Marlon having to bail his son out of jail. Apparently, he put up his "5 million dollar estate" as collateral. At this point, they cut to a 3 second helicopter shot of the estate. It was quite easy to see what appeared to be about an 80 ft tower with a 3 element beam on top.
It's on top of a hill, too!

Bob Witte is quite correct. You may not LEGALLY use a Marine VHF for land-only. Ship to ship and ship to shore are the intended uses. I believe that one could use Marine VHF for hiking and never get caught.

Handheld Marine VHF transceivers can be purchased for as little as $150 by looking in some marine catalogs. Those Radio Shack units can be had for as little as $175 if you look around (they are really REGENCY radios).

Another suggestion would be to use the belt clip (true) walkie-talkies that are sold by Radio Shack. I am told that they function quite well.

Patty Winter, N6BIS, writes:

<<Small clarification: we're now in the reply-comment period (till Sept. 7?).
So there's still time to give your opinions, only now they have to be in
response to the original comments instead of just anything off the top of
your head.>>

I didn't mention the reply period because (1) I doubt whether many hams will
take the effort that "our intrepid reporter" (KA9Q) has and actually *look*
at the comments that were filed, and (2) I didn't want to encourage folks to
send in comments that weren't valid replies (i.e. anything off the top of your
head.) The reply period is truly intended for that purpose--replying--though
it can sometimes get misused.

You're correct, though... and if people HAVE looked at others' comments
and feel they want to concur/nonconcur or simply discuss them further, then
by all means they should file replies!

I strongly suspect the 88-108 restriction in French models is to avoid an import duty. This band is used for wide-band FM bcsts as in the U.S.
The band below 87.5 contains the two-way business radios, etc.

Judging from comments made in Monitoring Times, Germans cannot legally listen to non-ham non-commercial bcsts. But I bet many do!

And if your used to the IC2 class of radios and like ICOM, they make a marine radio in the same family. Look at any AES catalog. They have been carrying marine gear for quite some time now.

Of course, comment #1 above still applies!!

I am hearing what appears to be cellular calls on my un-modified PRO-34. They appear in the middle 800 MHz band that the '34 allows you to receive. This is interesting since the 'excluded' bands of 870-890 is where cellular is supposed to be. Am I hearing another type of service? I hear all the beeps and squirts you normally associate with the audio band signalling of a cellular call-in-progress.

What other services besides cellular 'sound' like cellular and are located in the frequencies that the un-modified PRO-34 receives? I suppose this could be an image I am hearing. A friend of mine hears this on his '34 as well.

The long promised ARRL Microwave Handbook (I think its really called the UHF/Microwave Experimenter's Handbook or similar) is finally in print. I got my (author's) copy this morning. I havn't had a chance to read it in any detail yet, but on first glance it seems quite well done. It concentrates on basics rather than any detailed equipment design. That may come in a second volume, since I know that such designs were solicited (and submitted) when the project was started several years ago.

Sure, any you can't LEGALLY use a 2 meter HT either, but you PROBABLY won't
get caught... This is irresponsible, Marine frequencies are for for MARINE
use, AMATEUR freguencies are for AMATEUR use. Using either without a license
or on land in the case of marine, is strictly illegal and can cause harmful
interference. Please use CB or get an amateur license.

I have had to ask, politely, a couple of Extra Class FM ragchewers to move out of the satellite subband to allow me to copy DOVE. Yes they were rag chewing on 145.825, a frequency they said they had been using for years. Of course, since DOVE uses FM, I guess you think it should move out of the satellite subband too. The bandplan is voluntary now, of course, but the FCC officially recognizes 145.8-146.0 as a satellite subband so Extra Class amateurs with their superior CW skills should have known better. In fact, like most amateurs, these two Extras were gentlemen and allowed me to copy DOVE then asked about amateur satellites.

We gained two more satellite enthusiasts that day. I think that keeping the bandplans voluntary is in keeping with our spirit of self regulation. In this one case it exposed two old timers to a new mode.

I am getting ready to put up a large double extended Zepp antenna (IF I can
find any 12 ga. copperclad and IF I can find somebody crazy enough to go up
the giant redwood that will be one of the supports). I have a span of
approximately 300 feet to use, and the feedpoint will be about 175 feet
above ground level. This will be used mainly for 160 and 80 meter DXing,
though it could be used on the higher bands. My question is whether to fill

as much of the span with wire as I can or whether to cut the wire to be
resonant on the 160 meter DX slot. I remember seeing an article somewhere
recently on using a 160 meter loop on the higher bands, but nothing about
a Zepp. Does anybody on the net have any experience with this, or know of
a reference?

Well, I certainly know what you mean about "not advertising", but I
guess that I have a story...

When I said that I wondered what would happen (above) I was
talking about a state that I am not familiar with. In Minnesota,
hams are exempt from "scanner laws".

I was parked in a popular summer town talking to a couple of
other people between our respective parked cars. I was interested

in finding out what the local law enforcement people were doing, so
I put my '701 on band scan. I was waiting for it to find something
when a sheriff's car pulled up to see what we were drinking (pop
of course). :-)

Well, while he was parked next to me he ran the plates on
both cars and guess what? Yup, my scanner finally stopped and
HIS RADIO FED BACK THROUGH IT! I just walked over and turned it
off and that was the end of that.

I guess that the only thing that I have to say about this is
that Minn. luckily is not one of the states in question, and I
hope that my actions did not damage amateur radio's standing.

After scanning through the news for several weeks, I have found several topics of interest to me, and I would like to offer my comments on them, which I believe are constructive additions to the various discussions.

As a matter of introduction, I am a 38-year old extra class amateur radio operator licensed since 1967. I am a 100% CW operator whose interests encompass simple and economical antennas for Hf, propagation, traffic handling, DXing in connection with the study of antennas and propagation, and taking the time to discuss any topic of interest with another ham.

Here are the issues of interest to me and my comments:

1. Reasons for keeping CW.

    a. Its relatively small bandwidth makes good use of the limited amateur spectrum, thus enabling many QSOs to take place over a given frequency range. This feature is something that will become increasingly a factor in the near future as demands are made not only from within amateur radio but from without for more frequency spectrum.

    b. A message has a better chance of getting through under conditions of weak signal, interference, or noise.

    c. International communication is straightforward and simple with predefined Q signals and other accepted amateur abbreviations.

    d. Its simplicity enables any amateur, who is assumed to have a fundamental knowledge of the art and science of radio communication, to signal in the event of emergency when this most basic form of communication is required. The most appropriate instances are when one is isolated during an accident or natural unnatural disaster and other means of communication either do not work for reasons of equipment failure or because of inadequate signal levels at the receiver.

    e. CW is a skill that is achieved through the expense of effort. My personal belief is that something is appreciated more if one works toward a goal and achieves it as a result of his own ability and work. Something has little value if it is given outright with no corresponding expense of energy on the part of the recipient. In the present case, that something is the privilege to operate an amateur radio station.

    f. CW is a continuation of a form of communication that originated more than one hundred years ago, if not sooner. Today, it not only is still a proven fundamental means of communication, but it is an art form and a skill to achieve and to improve upon. It provides the user the opportunity to set several goals for desired levels of proficiency.

    g. CW permits one to have a conversation with another at a speed which is comfortable to the operator, and as a result, permits the operator to organize his thoughts so that a coherent and continuous exchange can take place. That is, there can be less pauses than are found in voice communication.

Vertical antennas.

I use two vertical antennnas at my station. One of them is the old and famous Gotham Vertical. When I ordered this antenna around 1973, I ended up paying more in truck freight charges for it than the antenna itself. The antenna is just two aluminum tubes, each one about 12 feet in length, and one put inside the other for about six inches or so and secured with a screwable clamp. I have mine mounted on a ten-foot 2X4, using PCV pipe cutouts as insulators, and supported with three nylon chords from top of 2X4 to three ground stakes. The antenna, therefore, is ground mounted, and I use sixteen radials going outward from the base. The antenna is tuned with a home made tuner for 20, 15, and 10 meters. I have contacted 162 countries with this antenna using 100 watts output. In my opinion and experience with the purchased Gotham Vertical, it is simpler to build such an antenna than to buy one. I suspect that some money will be saved in the process, but a greater gain is what one learns through the effort and, as always, the satisfaction of having done something with one's hands.

I also use a vertical helix antenna that is more experimental than the above mentioned monopole. It is operated in the normal mode. Refer to Antennas by John Kraus for this type. I constructed mine out of three lengths of PVC tubing and then stretched a toy slinky down its length, with the PVC tubing inside the slinky. I still use radials and my tuner described above. I use this antenna on 80 and 40 meters. I haven't been using this antenna for very long, but its performance seems adequate. I want to see how it performs in the winter time. I would be happy to give details of it to anyone who is interested.

Kenwood TS-940s

I use a Kenwood TS-940s. There are two fans on it. One of them pulls air across the heatsink for the regulators. The other one is used in the final amplifier section. The final amp fan never comes on for me, because of my CW operation. The voltage regulator fan does come on, and it cycles on and off, which appears normal. I followed the manual's instructions and lubricated the fan after six months, and have had no disagreeable noise.

I did have a problem with the unit just before the warranty expired. I noticed instability in the received CW signals and in WWV when listening to the carrier in CW mode. Also, the power supply area seemed to be hot all the time. Sometimes the frequency display would go out completely, and I would have to open up the chassis and hit the reset button. I sent the unit back to the dealer for repair, and upon return found that the problem was apparently in the need to resolder an area of the PLL board. Since receiving the repaired unit, I have had no problems with it.

Ham Radio Dealer

In connection with the comment above, my dealer was R and L Electronics of Hamilton, Ohio. They were courteous and handled my needs promptly. I was entirely satisfied with the repair that they made to my TS-940s.

QSL Responses.

I do mostly DXing these days, but do some local contacts as well. I send out a QSL card to each new contact I make, and reply to any QSL card that I have not otherwise acted on.

I keep a list of what cards I send out to the ARRL QSL bureau and to individual hams overseas or to local QSL managers. The US managers have responded to me almost 100 percent. Foreign amateurs respond better than 80 percent.

On each request for a DX QSL card I write a small note thanking the amateur for the QSO and saying that I would appreciate his card for whatever reason I am making the request.

On stateside non-DX QSL cards, I send by U. S. mail at 15 cents per card and request a card by checking the PSE QSL box. I don't feel that I am placing an undue burden on anyone by not furnishing return postage. If I don't get a card back, that's all right with me.

DX Pileups and the DXCC award.

> My own rule of operation is: listen, listen, listen. Be courteous. Be patient. Work toward the goal with reason. Let the other guy have a chance.
>
> I call a DX station if there are few enough amateurs calling that I think I have a chance of being heard. On heavy pileups, I don't bother. In such cases, I believe it would be wise for many operators to voluntarily back off.
>
> Some DX stations can organize the QSO by calling stations by number, i.e. NR 1, NR 2, etc. When that happens, I believe we should listen to his directions. Also, some DX stations say to call him

up 1 kHz or so, but some operators miss that direction and call on the DX station's frequency. Again, listen, listen, listen.

The DXCC award certainly is a measure of one's accomplishment in operating in amateur radio, but its value should be a reflection of quality operating and courtesy on the part of those who achieve it.

Overall view of amateur radio.

It is funny that in reading the news articles of several amateurs, that some things seem to remain the same: the discussions of the applicability of CW and other modes of communication, the status of particular classes of licensees, the perceived importance of the kind of call sign one uses, the mystery of electromagnetic radiation and its application, the threats to amateur radio from within and from outside. These issues, among many others, are not new to amateur radio, because I was exposed to them when I started, and I suspect that older amateurs share a similar point of view with respect to their memories of the past.

We should not lose sight of what amateur radio is about, however. In its most basic terms amateur radio is for experimentation, education, public service, international good will, and, certainly not the least, amateur radio is for fun. We have something which contains so much value and so much potential for good for others. I believe it is something we should treasure and preserve. I feel we can best do that by treating others with respect, courtesy, calmness, and reason. There are certainly abuses within amateur radio and issues of use of spectrum by outside interests. These issues can be met in an organized way and dealt with. If, however, the amateur community as a whole cares little about its integrity, it will ultimately be splintered, and its effectiveness as a constructive resource for the community will be lost.

I have had many QSOs in my amateur radio experience, and from this I believe that most amateurs are good operators and care about their avocation. There certainly is hope for amateur radio, and that hope comes from the majority of amateurs who support the fundamental principles of amateur radio.

73,

Rick Gaus
WA3INC

P. S. If anyone would like to discuss any of the topics further with me, or anything else, I'm on CW most evenings on 80, 40, or 20 meters depending on propagation conditions. Look on 3.500

to 3.525, 3.677, 7.000 to 7.025, and 14.000 to 14.025 MHz. I spend most of my time listening for DX so you may not hear me. Call me on frequency or make a sked through email or better yet, send me a message through the National Traffic System the old CW way.

Disclaimer: The above opinions concerning amateur radio are my own and do not reflect in any way the position of the company for which I work.

Thank you! One more question, if you don't mind. Do you know what % of the general poplace is involved in Amateur there? It'd be fascinating to compare how many per thousand are amateurs there with over here.

That's a cop-out, Jay. It also assumes that the FCC is unwilling to listen to public comment. While that has been unfortunately true on some occasions (read: 220-222 MHz), throwing your hands up in the air and saying, "they won't listen anyway" isn't the answer. Of course, now when the FCC comes up with a no-code license you can tell everybody, "I told you so."

As of a year or so ago they were in existance, located in the Southwest. (Arizona, I think.) The fellow running the place is, I believe, one of the original principals. (I'm not at work and don't have the name in the internal memory bank.)

The reason I know this is that they upgraded a Milspec 1080C radio that was donated to ARRL, putting in the latest microprocessor control. Apparently they are selling these radios to automated RTTY (SITOR?) stations. Signal One has software that allows remote control of these stations using IBM PCs.

```

> ...maintain a charge on a gel-cell from an automotive electrical system.
> ...hook up a low-voltage-drop voltage regulator IC in constant-current
> mode...

There's a simpler way that works for me. Whatever your personal standard 12V power connector system is (*), build a unit like this:

```
         hot   source
         ______________| |_______________
     sink-------------------------------sink
         ground
```

Plug your car (source) into one sink, your gel cell (other source) into the other sink, and a portable light (sink) into the source. Use an appropriate light. For instance, WalMart sells a magnetic stick-on 12V light for under $3 that's about the right resistance.

The light bulb is a variable resistor that limits maximum current flow a to safe level. At low current flow it's a low value resistor. The difference in voltage between the auto (when running!) and the gel cell is enough to push charging current into the gel cell, just like the car battery. Disconnect when the car is off, just in case the gel cell is higher voltage.

The light bulb is also a nice visual indicator of current flow.

(*) Every ham should have a personal standard 12V connector system. For years I built various doodads without thinking of consistency. When I got licensed my ham friends turned me on to the idea. I put some thought into it and decided to be compatible with one of them. We use 6-pin 0.093" Molex connectors, available from Radio Shack and other places. Not cheap, about $1.40 each, but they provide added pins for audio, etc. if needed.

Having standard, keyed connectors means you can't accidentally mis-plug anything -- except through a weird cable like the one above. Here are examples of my 12V sources and sinks:

sources:
 auto female cigarette lighters
 auto direct-wired fused connectors
 gel cell
 12v plug-in supply

sinks:
 HT
 10m rig
 VCR record unit (also has a built in gel-cell charger)
 portable lights
 auto vacuum
 cassette player

pescatore_jt%ncsd.dnet@GTE.COM posted something headed:

>>Subject: Low SNR Code Debate: K5ZC is in the numerator

I think you meant to say denominator? - kids these days just don't
know any mathematics! - or perhaps it was meant as a compliment.

He also says:

>>I think it is a lot more fun talking to a 16 year old who is at
>>a high school station than to a 85 year old at a retirement home.

This is an unfeeling sort of thing to say. When you reach 85, and
the only fun left to you is your ham rig, you might enjoy QSOs with
middle-aged gents. There are a lot of old farts on the air, for sure,
but there are also some middle-aged ones and some objectionable young
hams as well. I've heard guys in their mid-70s who can still send
CW (you should pardon the expression) at respectable (30+ wpm) speeds,
and I'd rather have a QSO with one of them than with some kid who can
only send at 10 wpm.

While I understand the concern about the lack of young blood, you have to remember that hamming is one of those hobbies that you can continue well beyond retirement, yeah, even into a retirement home, unlike water-skiing, drag racing, pole-vaulting and so on.   I expect there is even an increase in most people's hamming when they reach retirement age.

I should admit that this comes from someone who resigned from the ex-G club on the grounds of not being ill enough to be a typical member, thereby provoking violent mail from one of the elderly patrons...

> hams. KE3Z, if you do circulate any of these missives around HQ, I'm afraid
> the ARRL in particular will forget about the long term problem during the

Just so you know, I _don't_ normally distribute this stuff. Occasionally I'll pass along something of interest to a particular individual who might find it useful. That happens maybe once a week. I don't make this stuff generally available at HQ because 1) the benefit wouldn't be proportional to the effort, and 2) not my job, mon. If HQ ever gets a LAN, I'll make news available there, but printing it out or passing disks around is too big a hassle.

So, if you folks thought that your brilliant postings, which contain clear solutions to all of Amateur Radio's problems, were being avidly read by the ARRL power structure, it ain't so. Sorry!

I read your message with pain and sadness. I don't know any way to tell you that your experience at the hands of a few selfish individuals is not representative of the ham radio I know and love, and that has given me as much as, if not more than, I have put into it, since your experience obviously differs from mine.

I have great respect for your level-headedness, and your contributions to Usenet are legendary (a few malcontents notwithstanding). I think you'd be a valuable asset to ham radio, and would get a great deal of enjoyment out of it.

My comments aren't directed at the minority of potential hams that have been turned off by the code requirement in your class, but the much larger contingent to be heard, for example, between 27.405 and 28 MHz bragging about how they could pass the theory test with one hand tied

```
behind their backs, but how they won't bother to learn the code. I have
no use for them.

Please don't assume that I feel the same way about you that I do about
them.

InstantTrack is not a public domain program!! It is copyrighted by Franklin Antonio and is available from AMSAT-NA, a non profit organization devoted to designing, launching, and using satellites for Amateur radio. Version 0.85 was a test version. V1.00 includes more features and the ability to control antenna rotators to track the satellites. AMSAT is asking for a $50 donation in return for the latest version of InstantTrack. If you like InstantTrack, I reccommend getting the update. AMSAT also has an monthly newsletter that has more detailed info on the amateur satellites and how and what they are used for.

AMSAT-NA's address is

AMSAT-NA at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062

Regarding portion of Netherlands population who hold ham licenses, I hereby reproduce a table from my filing on PR 90-55.
Hope it helps.   Bob W3OTC

Sorted by Amateurs per Capita   Sorted by Density of Stations

Amateurs per Thousand Population	Country or State	Country or State	Amateur Stations /sq mi	Total Population /sq mi
12.*	Japan	Japan	6.5*	844
2.4	California	New Jersey	1.667	985
2.0	Indiana	Netherlands	1.111	931
1.9	Denmark	Great Britain	0.714	601
1.9	New Zealand	West Germany	0.667	626
1.8	USA (50 states)	Denmark	0.625	305
1.8	New Jersey	Belgium	0.417	840
1.5	Sweden	California	0.416	174
1.4	Norway	Indiana	0.294	153
1.3	Australia	Spain	0.200	204
1.2	Netherlands	Italy	0.167	493
1.2	Great Britain	USA (50 states)	0.125	68
1.2	Mississippi	Sweden	0.071	48
1.0	West Germany	France	0.062	252
1.0	Canada	Mississippi	0.062	55
0.96	Argentina	New Zealand	0.062	32
0.93	Spain	Norway	0.045	33
0.49	Belgium	Argentina	0.035	30
0.32	Italy	Australia	0.006	5
0.25	France	Canada	0.006	6

Table 1 - International Amateur Data

* Since Japanese operator licenses never expire, this number is a count of all licenses issued, not a count of currently-active amateurs. For example the 1990 International Call Book lists 34,344 Japanese amateurs, a far cry from the claimed "one million". About 80% are no-code licensees who can operate all modes, 10 W, all bands except 10 and 14 MHz. Japanese amateurs and this factor is reflected in these computations.

COUNTY HUNTERS:

I hope this type of posting is OK and within the ethics of county hunting.
I live in the Upper Penninsula of Michigan (da YooPee) and I have discovered
county hunting. What fun.

I have found few folks up here intersted in county hunting or activly providing
these counties. I will be more than happy to make schedules for most of the
counties in the U.P. 20 and 40 meters are best for me, but I will try anything
on HF.
The central counties of Marquette, Delta, Alger, Schoolcraft, and Dickenson are
real easy to get to (I live in Marquette), the others need a little more
planning. Evenings and weekends of course are the best.

Please send me e-mail with your requests, no need to clutter the net with
important ham stuff and detract from the constant drivel of no-code and whether
or not you can use your radio on an airplane.

73,
Michael, WA7SKG

As quoted from <P09&N&C@splut.conmicro.com> by jay@splut.conmicro.com (Jay "you ignorant splut!" Maynard):
+---------------
| larger contingent to be heard, for example, between 27.405 and 28 MHz
| bragging about how they could pass the theory test with one hand tied
| behind their backs, but how they won't bother to learn the code. I have
| no use for them.
+---------------

Neither have I --- but this says more about the weakness of the theory examination than it does about the code. (And the kind of "study guides" I've seen out there don't help. I think I've bought my last Gordon West study guide; I'd rather learn something.)

++Brandon

With all the debate over code .vs. no-code and all of the hassles here regarding "our other problems" I must ask the following questions of all who participate in this conference.

What have you done for the hobby lately ?

How many of you have encouraged others to join in the fun, AND have help them by way of your experiences ?

In addition, how many of your responses to 90-55 where as thorough as the one written by Phil Karn? (whether or not you agree or disagree with what Phil had to say)

It is true that incentive licensing has been a failure, but what has to be done to correct it. The FCC is downsizing its staff and from a recent visit/discussion with them it looks like without any valid input we may see the following as a result of 90-55.

Communicator Class -----	ALL Privs above 30Mhz	NO CODE
Novice Class	Current Privs	CODE 5 WPM
NEW CLASS	ALL Privs	CODE 5 WPM

ALL Tech,General, Advanced and Extra would become this NEW CLASS

The above only because of (in the opinion of the FCC) it would reduce the burden on their system. The person I spoke to said that the only changes that would be acceptable to them are ones that would save them money and people. Yes they care, but are really budget constrained.

We can discuss and argue all of these points as we have been doing or we can do something to help everyone enjoy the hobby.

>they'd like to sell even though it works well?

Unless you are on a boat, using the marine band radio is illegal.

```
  (There may be an exception or two, but I don't think hiking applies.)

     OK! its survey time, and I need some real data for my work.

     I would like to know how many people in this newsgroup actually
     hold CSCE's for higher grade licenses but have the code that is
     holding them back OR who hold CSCE's for a higher grade license
     but have the theory holding them back.

     1. Current License held if any ?

     2. CSCE held element(s) ?

     Please respond  via e-mail not as a reply to this note.
     I a few weeks I will publish the results.

>and saying, "they won't listen anyway" isn't the answer.  Of course,
>now when the FCC comes up with a no-code license you can tell everybody,
>"I told you so."

I gave long thought to whether or not I was going to file comments
before making my decision not to. The FCC has indeed lately been
unwilling to listen to public comments that oppose a particular course
of action - witness the 220 grab. I have no reason to believe that any
individual's comments - no matter what they said or how well they were
written (and, from Phil's description, I could most likely do better
than most of the comments opposing a no-code license) - would materially
affect the Commission's opinion. I decided not to invest mountains of
effort in beating my head against a wall.

That does, of course, lead me to wonder what the hell I've been doing
here for the past year or so...between pointing out the realities oof
frequency coordination, and being one of a few pointing out the myriad
problems associated with lowering the standards of admission to ham
radio, I suspect that I don't get listened to very much anyway. *sigh*

Maybe I'll quit beating my head against this particular wall, too.

I'd say it says at least as much on how easy it is to brag. My bet is that
if/when codeless Ham comes to happen, most of those braggarts will find some
new excuse to not bother getting their ticket -- it's easy to talk.

In as far as 10-codes go, I too have found MANY variations. Just in my
commute, I pass through 5 or 6 cities and 2 counties. Each may have
its own different set of codes.

In searching for answers in the jumble of codes, I have found an EXCELLENT
reference (especially for metropolitan areas). The book 'MONITOR AMERICA'
has proven to be a FIRST CLASS aid in targeting frequencies of local/state
agencies AND many PRIVATE agencies and also provides codes used in many
areas. The book covers all states in general and most metro areas.

Monitor America was published in a 85-86 edition and was never updated due to
the time and money it took to publish the book and the relatively low volume
of units sold. Even with its age, I don't know what I would do without it!
It is published by SMB Publishing and is available at almost every store
that deals in scanners.

As for California, many departments use Penal Codes and Vehicle codes for dispatch. A Vehicle Code book is avaiable from the Department of Motor Vehicles for $3.00 (a good buy in today's world). Also included in the DMV Vehicle Code book are the Penal Codes!

If anyone has any questions about codes used in the Monterey or SF Bay Areas, please feel free to mail me.

Why do Germany and France not allow the sale of radios which get these frequencies? Also, is it really illegal to sell a ordinary FM radio (88-108MHz) in France?

I have been asked by W3XO to post his 90-55 comments to the net; here goes:-

Before the
FEDERAL COMMUNICATIONS COMMISSION
Washington, DC 20554

PR Docket No. 90-55

In the Matter of
Amendment of Part 97 of the)
Commission's Rules Concerning)
the Establishment of a Code-free)
Class of Amateur Radio License)

Submitted by
William A. Tynan W3XO
HCR 5 Box 574-336
Kerrville, TX

Summary

I support the basic concept of creating a code-free class of Amateur Radio license provided that it is established with goals of:

1. Encouraging responsible and knowledgeable people, particularly young people, to enter Amateur Radio.

2. Leading to an increase in the utilization of the higher frequency Amateur bands (220 MHz and above).

3. Not increasing the difficulty of entering Amateur Radio for those who might not be as knowledgeable and technically qualified as perspective code-free license candidates might be.

4. Not disrupting current valuable amateur activities.

Background and Qualifications

I have been a licensed amateur since 1945, with the original call, W3KMV being issued about six months later. I began with a Class B License and obtained a Class A in mid-1946. In the mid-1970s I obtained an Extra Class License and requested, and received, the present call in 1976. I have operated all Amateur bands from 160 meters to 70cm with the exception of 30 and 17 meters. My principal interest has been in the VHF and UHF range and I am especially active on 6 meters using SSB and CW. I have contacted a total of 101 countries on that band. I have also been active on the 2 meter band, using all modes; CW, SSB, AM, FM and packet. Before leaving Maryland at the end of 1988, I had contacted 37 U.S. states on the 2 meter band. Since 1975, I have been the conductor of QST column The World Above 50 MHz which is devoted to reporting events in the VHF, UHF and microwave Amateur bands. I was a founding member of the Radio Amateur Satellite Corporation (AMSAT) and have served twice on its Board of Directors. I am currently an AMSAT Director, as well as its Vice President for Manned Space Programs. In that capacity, I have authored three proposals, which were submitted to NASA Headquarters jointly by AMSAT, and ARRL. These led to operation from the Shuttle by licensed Radio Amateurs. In my professional life, I was employed by the Johns Hopkins Applied Physics Laboratory Laurel, MD from 1951 until retiring in March 1988. There, I attained the position of Senior Engineer and worked on a number of U.S. Navy weapons programs.

I graduated in 1950 from Rensselaer Polytechnic Institute Troy, NY with a degree in Management and Electrical Engineering.

I believe that my many years as an amateur, my current position as conductor of The World Above 50MHz and my association with AMSAT gives me a particular insight into the ramifications of establishing a code-free license, influenced especially by the privileges the Commission sees fit to grant its holders.

I cite my background and affiliations only to establish my credentials to comment on this NPRM. The comments contained herein are not to be taken as representing the views of any of the organizations with which I am, or have been, affiliated. They are strictly my own.

The AMSAT Board voted unanimously to support a code-free license, some months before the ARRL established its committee to study the mater - and ultimately submitted a Petition for Rulemaking. Our reasons for suggesting the establishment of such a license were based on meeting two principal objectives.

1. Increase the amateur population on the higher bands, especially the bands above 1 GHz.

It was felt that this is particularly important in the light of the approaching WARC; in which it is believed that great pressure, particularly from European countries, will be exerted to reallocate parts, or all, of these bands to other services. Since continued amateur allocations in this part of the spectrum are considered vital to the future of the Amateur Space Program, the AMSAT Board members favored, and still favor, any steps that can be taken to promote amateur occupancy of these bands.

2. Bring more talented technically minded people into Amateur Radio. The AMSAT Board members feel that there are many people, especially young people, who are intrigued by today's technology such as computers and space, but are deterred from becoming licensed amateurs by the need to learn the Morse Code. A majority of the Board believes that the problem is not with these people's inability to learn the code, but rather, their conviction that it irrelevant to today's communications techniques. (While I do not subscribe to the view that Morse Code is irrelevant, I do understand how some people can reach this conclusion.)

The decision of the AMSAT Board was informally conveyed to various ARRL officials, and may have contributed to the League's establishing a committee to study matter and later submit a Petition for Rulemaking. The Tucson Area Packet Radio (TAPR) organization's Board of Directors reached a similar conclusion about the same time. Its action was also made known to League officials. In this way, although AMSAT did not submit its own Petition for Rulemaking, I feel that the AMSAT and TAPR Boards' decisions contributed significantly to the process which led to the League's Petition and the Commission's subsequent NPRM.

Comments

I have had, and continue to have, reservations as to the need and desirability of establishing a code-free Amateur license. I have always felt that the accomplishment of learning the Code represents a commitment on the part of perspective licensees. I believe that it demonstrates that the person is really interested in Amateur Radio as a hobby, rather than merely a means of getting on the air to satisfy some specific need for communication. However, since I supported the AMSAT Board in its un resolution on the matter, I do not feel that it would be proper to take a different stand in these proceedings. I, therefore, support the establishment of a code-free license provided that it fosters the two objectives cited by the AMSAT Board. I will address my specific recommendations for accomplishing this in the following paragraphs. I have some additional concerns which are raised by the Commission's release and will also address these.

As stated above, I support the concept of a code-free license provided it is aimed at attracting people who are seriously interested in Amateur Radio as a technical hobby, not merely the desire to "talk on the radio", or for the purpose of establishing some specific communication link, such as with a spouse. For those for whom such an application is their principal aim, the 27 MHz band is available. To implement the objective of recruiting people really interested in radio, I believe that the written exam should be designed to require real learning of a broad range of radio and electronic theory, not merely memorizing the answers to a few questions. It may be that the 60 question test proposed by the Commission is consistent with this aim. However, I do contend that some questions relating to digital theory should be included as the people interested in that aspect of technology are among those we should be attracting to Amateur Radio through the code-free license. Nevertheless, I don't consider myself an expert on designing tests and will leave the details to those who are.

I support the Commission's proposal to limit the privileges of the new proposed license to the 220 MHz band and above. (The Commission refers to it as 222 MHz.) I believe that this is consistent with the objective of encouraging an increase in the occupancy of the higher bands. I might even limit code-free licensees to 1240 MHz and above, but I understand the need to not relegate them to a "ghetto"; but, rather, make the license something that can be useful immediately. In most populated areas, there is significant activity on the 1-1/4 meter and 70 cm bands. The granting of Novice privileges on the 1-1/4 meter band has materially increased activity there and many 1-1/4 meter repeaters are now linked to 2 meter repeaters. This permits Novices and, ultimately, code-free licensees to communicate with amateurs using such cross-linked repeaters. I am aware that some individuals and organizations favor permitting code-free licensee use of all VHF and UHF bands (50 MHz and above). I believe that this would be counter-productive to the objective of increasing occupancy of the higher bands. Futhermore, I feel that it could also have a severe detrimental impact on current operations on the 6 and 2 meter bands. I point out that, in its NPRM, the Commission states that one of its objectives is to "avoid any negative effect on current licensee...". If the Commission sees fit to grant code-free licensees access to 6 and/or 2 meters, the "effect", so produced, can be minimized by instituting other rule changes, which I will discuss. Particularly in the case of 2 meters in the large metropolitan areas, crowding and inter-mode friction is becoming increasingly serious. Most people, in and out of Amateur Radio, seem to believe that amateurs use VHF almost exclusively for wide band modes such as FM voice, packet radio and amateur TV. They fail to consider the important minority which employs narrow band transmission modes such as SSB and CW to great advantage on these bands. It is almost solely these people who are learning to take advantage of the more obscure types of radio propagation, such as tropo scatter, ionosphere scatter, meteor trail reflections, moonbounce and amateur satellites. Signals from distant stations, propagated by such modes of propagation, are not even noticed by those using FM and other wide band transmission modes. It is the people who utilize narrow band/weak signal techniques who are constantly designing and building more effective antennas to attempt to obtain that last fraction of a dB of gain to take advantage of such, usually weak signal propagation. The same goes for RF power amplifiers and low noise receiver preamplifiers. Not surprisingly, the amateurs interested in weak signal narrow band VHF/UHF and microwave work, do much more building than does the average amateur. The fact that such operators are not in the majority should not be used to dismiss them as unimportant and insignificant. But that is what is currently happening, especially on 2 meters around the large cities. The increasing use of FM for both voice and packet radio will soon make weak signal work all but impossible for many of our active SSB/CW operators. Current FCC rules permit wide band modes, based on FM, to be used anywhere above 50 MHz, with the exception of the segments 50.0 to 50.1 and 144.0 to 144.1 which are reserved for A1 (CW). As beneficial as these CW preserves are, they do nothing to prevent people from operating FM anywhere else in the VHF spectrum. And many do - especially on 2 meters. In recent years, numerous local voice nets and many packet services have cropped up between 144.3 and 144.5. Some have even been "coordinated" by local and regional frequency coordinators. This is despite the fact that the ARRL Band Plan and many years of custom have defined the 144.0 to 144.5 MHz and 50.0 to 50.5 segments as being for narrow band transmission modes. AMSAT announced in the early 1980s its intention to use the 144.3 to 144.5 segment for future amateur satellites. It did so, feeling that such use should be generally compatible with the use being made of those frequencies by weak signal terrestrial operators. This intended satellite use was subsequently reflected in the ARRL Band Plan. With the launch of OSCAR-13, that use was begun - only to experience serious interference from FM operators; and howls of protest to the effect that "those space people are trying to grab our frequencies".

I firmly believe that, if code-free licensees are given access to 6 and 2 meters, and no other new rules are instituted; the pressure on weak signal work from FM operations will increase to the point that weak signal work on 2 meters will not be possible throughout much of the country. If that is allowed to happen, Amateur Radio will lose some of its most dedicated and valuable practitioners. Such an eventuality can hardly be construed as meeting the Commission's third objective of " avoid[ing] any negative effect on existing licensees". While FM inroads are not as pervasive on 6 meters as they are on 2 meters, indications of trouble ahead are already evident there also. For example; an influential 6 meter group in southern California has, for several years, been actively promoting the use of 50.3 MHz as an FM channel. To prevent further pressure on weak signal/narrow band operators, I strongly oppose the opening of 6 and 2 meters to code-free licensees; unless the Commission is willing to also adopt rules reserving 144.1 to 144.5, 50.1 to 50.5 and the satellite segment, 145.8 to 146.0 MHz for narrow band modes consistent with AM, SSB and CW. An exception must be placed on 145.8 to 145.0 to permit FM for orbiting spacecraft. (I have included AM, even though there is little current AM activity on these bands.) Furthermore, I urge that such a rule be adopted even without opening up these bands to code-free licensees.

If the Commission decides that code-free licensees should be permitted on 6 and 2 meters, the current band users can be expected to welcome the new operators, provided they employ the same transmission modes as are now customary. However, since I feel that, no mater what kind of exam the Commission develops, a majority of code-free licensees will use FM modes, mostly because that's what most amateurs, and non-amateurs, think VHF is for. In my opinion, the surest way to make the new licensees feel unwelcome is for them, possibly inadvertently, to begin by using FM on portions of the bands customarily employed for weak signal work. If code-free licensees are given access to 6 and 2 meters; the way to assure that they do not run into hostility, from this cause, is to have, in place, clear rules for them, and everyone else, to follow.

The Commission asks for comments regarding possible HF CW privileges for code-free licensees. I believe that such privileges would be counterproductive to the objective of populating the higher bands, as well as creating significant monitoring and enforcement difficulties. Even if, in order to comply with ITU regulations, they are precluded from contacting stations outside the U.S. their signals would, nevertheless, travel beyond national boundaries. Additionally, enforcing such a ban would be almost impossible.

I believe that the Commission's proposal to eliminate the Novice Class License is counterproductive to that class's long standing objective of introducing new people to Amateur Radio. As stated above, I do not feel that the proposed code-free license has, or should have, quite that same objective. It should, I believe, be aimed at bringing in the more technically inclined people who see no place for Morse Code in modern communications. The Novice Class has just the opposite objective. Its goal has always been to bring new people into the hobby in a manner which encourages them to use code, and thus improve their skills with it - the more traditional approach to Amateur Radio, if you will. In my view, the more difficult technical exam, which the code-free license should carry and is proposed by the Commission, will be a significant deterrent to new people, who might otherwise enter Amateur Radio via the Novice License. Having both code-free and Novice Class licenses will provide a dual entry point to Amateur Radio. This could be very beneficial in recruiting the greatest number of new Amateurs. I see no reason why the Novice examination cannot be integrated into the VE system, either with or without reimbursements. The reimbursement involved is not significant in terms of the spending habits of most of today's young people. Provision for a way to handle cases of real financial hardship could, however, be included in any new rules and, if instituted, should apply to all license classes.

I contend that the Commission's proposal to eliminate the Technician Class License is also unwise. The Technician Class constitutes a general VHF license, allowing those who are interested only in that part of the spectrum full privileges. A significant percentage of people whose main interest is VHF operation are Technicians. Many of them do not upgrade simply because they have little interest in HF operation. Some weak signal VHF operators are Technicians - although a much larger percentage hold higher grade licenses. I recommend that the Technician Class license be retained and that code-free licensees, who pass the 5 word per minute code test, be upgraded to Technician. Code-free licensee who pass the 13 word per minute code test would be upgraded to General Class. The Commission's proposal to forever saddle code-free licensees, who pass a code test, with a callsign suffix is unwieldy, unfair and unnecessary. It seems to me that the Commission is merely taking on an additional monitoring and enforcement burden which is inconsistent with tighter budgets now in vogue. I do not believe that the increased burden of issuing upgrade licenses is greater than the hardship and headaches the Commission will be generating with perpetual suffixes.

The Commission proposes to issue code-free calls from the same block as Novice. In my opinion, a better approach would be assign a new callsign block to them, for example 2 by 4s, or 2 by 3s beginning from the end of the alphabet, e.g. prefixes such as WZ, WX, WY..., KZ, KX, KY.... When, and if, a code-free licensee upgrades; he or she should be given the option of obtaining a new call or keeping the old one. While such an approach makes monitoring more difficult, it is exactly the policy being followed today.

Keeping both the Novice and Technician Classes, while adding a code-free class, still falls within the Commission's need to keep the total number of license classes to six. I have received information that the volume of Form 610s the Commission processes each year, has become a problem. This is, apparently what led to the proposal to eliminate the Novice and Technician licenses. I sympathize with the Commission's dilemma in this case, but suggest that it is attacking the wrong end of the license ladder. I would rather see the Advanced of Extra Classes dropped than the Novice and Technician. The most appropriate solution, however, would be to institute REASONABLE filing fees ($10 per filing). I believe that amateurs would support a nominal fee such as that, if the money would go directly to the Commission rather than into the general revenue. However, a $30 to $35 filing fee, with the proceeds going to the Treasury, which Congress debated last year, would (and did) meet with stiff opposition. I recognize that institution of any filing fees requires Congressional action.

What's in a name? I believe quite a bit. The Commission has followed the ARRL proposal to call the code-free license "Communicator". I consider this a most inappropriate name, as it carries the "talk on the radio" connotation, rather than the "participate in technology" approach. In other words, I believe the name "Communicator" will send entirely the wrong message to perspective licensees, as well as commercial interests coveting additional Amateur frequencies. While no name is perfect; I propose the name "Experimenter" as better typifying the purpose which, I believe, the code-free license should serve.

Specific Recommendations

I urge the following actions by the Commission in this proceeding:

1. Institute a code-free class of Amateur Radio license called the "Experimenter Class" with a written test which is at least as difficult as the current Technician/General exam and preferably of greater difficulty, with digital questions included.

2. Provide privileges for Experimenter Licensees on 220 MHz and above with the same power and transmission modes as are now available to Technician and higher classes on those bands.

3. Retain the Novice and Technician Class License and put the Novice examination under the VE program.

4. Upgrade Experimenter Class licensees to Technician upon passage of a 5 word per minute code test and General upon passage of 13 word per minute code test. This approach negates the need for special suffixes forever carried by code-free licensees who have passed a code examination. If this requires the elimination of a license class, drop the Advanced and/or Extra. I believe that such action should be a subject of a separate Rulemaking, however.

5. Issue distinctive callsigns to Experimenter Class licensee but allow them to retain these calls upon upgrading.

6. If the Commission sees fit to grant code-free licensees access to 6 and 2 meters, institute new rules excluding FM operation from 50.1 to 50.5, 144.1 to 144.5 and 145.8 to 146.0 MHz. Some provision should also be made to protect weak signal modes in the 220 to 225 MHz (or 222 to 225 MHz) band, but the specific band segments so protected must await ongoing allocations proceedings. I urge the adoption of these protected segments whether or not a code-free license is instituted and regardless of its privileges. The situation is becoming intolerable in many areas even under the existing licensing structure. I am currently preparing a separate Rulemaking Petition on this subject.

Respectfully submitted,

William A. Tynan

While on a Carribean cruise, I was able to wrangle a tour of the radio room. Thinking that a commercial enterprise would have the most up-to-date equipment, I was surprised to see an 800 watt HF rig (complete with code key). The frequencies were different, but it had nothing on my old TS520.

While there was a VHF packet (X.25) link via satellite to the home office, it wasn't primarily used because it was too expensive. What got used was a clunky 110 baud modem connected to a radiotelephone that operated over HF (and who said HF was dead :-). On the other end of the modem was a PC.

If you have the opportunity, tour the radio room of a commercial ship. They seem to be heavily into "cheap" and "reliable".

Since some comments have been made about licensing in 'G', here is some grounding for you to argue about;

There are two classes of Amateur Radio license in 'G' land, called Class 'A' & Class 'B'. The only difference between them is the Morse test. They both sit the same exam (a 2 parter, multi-choice, takes about 3 hours total). If you pass both parts of the exam, you can apply for a 'B' license which gives you full privileges from 30MHz up, including the ability to use Morse, if you so wish, but you must ID on phone (because "your code is not guaranteed to be readable" - whatever that means.) If you wish HF privileges, you sit a 12wpm Morse test, both send and receive, text and figures. Effectively you must have 100% copy in receive, no uncorrected errors in sending (and a limited number of corrected errors!). If you pass, you get an 'A' license which allows you to operate from 30MHz down as well as up. If you already have a 'B' license, you get a new callsign. 'A' calls are; G0, 2, 3, 4 + 3 letters, G6+2 letters (obsolete), 'B' calls are G1, 5, 6, 7, 8+3 letters.

Now for a contentious statement. Since the introduction of the no-code ('B') license, approximately 80-90% of 'A' license holders start with a 'B' license, then move on to learn the code in order to get HF privileges. That says to me that no-code *is* a good way to get people into the hobby.

But - The British ham population is ageing, as in the USA. *So*, the code isn't the only reason why people don't enter. And I think the reason they don't enter is because amateur radio is essentially an invisible hobby. Nobody knows we exist. Someone said it was "a bunch of nerds tinkering in their dungeons", and he was right. So the RSGB has instituted Project YEAR (Youth into Electronics via Amateur Radio - and yes, it is a crap acronym.) This project has the support of many organisations such as the Department Of Trade and Industry, the BBC, the RSGB, the Department of Education, some of the trade organisations, and so on. It's serious enough that the DTI have donated a cash prize for Young Amateur of the Year, plus various other people have donated time, effort and money. It's based on mutual self-interest; The establishment realises that we are desperately short of electronics engineers and the amateurs realise that we need more amateurs. By doing this, the establishment has shown that they think Amateur Radio is more than just a hobby - it's a way of getting people into the electronics industry (where, by the way, Morse Code is about as relevant as a bicycle is to a fish.)

But, we're still not hitting the target audience. Young people. The RSGB are producing a video, a magazine aimed at the younger audience, and they are working on a Novice License with an easier exam than the 'A' and 'B' test, plus a 5 wpm Morse (sigh) test. On a personal level, our club called all the local schools, Youth Groups and Scout and Guide groups, and invited them to a series of meetings. About 60 kids turned up. (Incidentally, although we wrote to all the local high schools, not one bothered to reply.) One month we talked about "What was Amateur Radio", another month I gave a talk about and demonstration of packet radio, and another member gave a demo of satellite technology. Frankly, we had to beat the kids off with a stick. They were *fascinated*. We got dozens of enquiries, and several new members out of it.

So, whilst the code *IS* a barrier to new entries, removing this barrier isn't necessarily going to bring in floods of new people. You've got to get up off your fat ass and *do* something about it. That's the difficult bit - blowing hot air on the network doesn't count doodley-squat.

Sorry I waffled on so long.

73, Hugh Davies, G0CNR
(Yes - An 'A' licensee. And yes, I came in via no-code, I was G1BUE then.)

Hi y'all!

My access to info-hams is not what it useta be; instead of all the neat "incoming" mail messages, I am now getting only the digest so I can no longer use the VAX Mail features for scanning messages, etc.

Can someone recommend a friendly mail reader? I have the directory listing from SIMTEL20's pd:<MSDOS...> directories, but have not found anything that looks like what I want.

I am on a non-UUCP site, so I have to do GET's in the blind... if anyone can tell me where to look, I can give it a shot, otherwise I have a long turnaround on "exploring" via BITFTP.

Thanks & 73,
Bob WA8YCD

I hope you also have 2 separate supply lines else all your efforts are in vain. Ideally you should have 2 power supplies to feed your repeater. One designated "dirty" for the logic and switching circuits, the other "clean" for the analog circuits. This will remove any mutual coupling from having switching spikes in the same lines as the analog power. The two grounds would then be taken to an earth bonding point but as no current will flow in these lines, noise will not be induced.

However, I am a realist and the practical solution is to common the ground rails at the PSU and connect the analog power rail to the PSU via a filter (RC for low current LC for high current).

Hope this helps.

jay@splut.conmicro.com (Jay "you ignorant splut!" Maynard) writes:

>I gave long thought to whether or not I was going to file comments before making my decision not to. The FCC has indeed lately been unwilling to listen to public comments that oppose a particular course of action - witness the 220 grab. I have no reason to believe that any individual's comments - no matter what they said or how well they were written (and, from Phil's description, I could most likely do better than most of the comments opposing a no-code license) - would materially affect the Commission's opinion. I decided not to invest mountains of effort in beating my head against a wall.

On the other hand, there was a note posted on the net today saying that because of feedback the FCC is considering changing the Communicator class to be anything greater than 30MHz rather than the original proposal. So if they're not listening, they're independently coming up with some interesting ideas.

If you don't file your comments, Jay, they can't listen even if they want to. You've made the decision for them. If you file and they pay no attention, there's not a lot you can do about it, but failing to file cedes the defeat before you even started the battle. Don't give them any excuse to ignore you.

This is a periodical (monthly) posting to announce the availability of CAPITAL, a Civil Air Patrol electronic newsletter published on a more or less weekly basis.

The Civil Air Patrol is an auxiliary of the United States Air Force, that provides emergency services (including search and rescue missions for downed aircraft), aerospace education, and a cadet program. As part of its operations, the Civil Air Patrol operates a radio communications network.

If you are interested in receiving this newsletter, please send your name and InterNet address to aviator@athena.mit.edu. If you are a current CAP member, please include grade, squadron, charter number, and callsign. Submissions will also be accepted at this address, along with back issues requests.

Please feel free to distribute this article further.

Again, why? Commercial DSP equipment exists, and more is on the way. Also, why does this have to be a youngster? Since presumably we'd like to get more tech folks into ham radio (the ones who have the loudest -- and fairest -- case against CW). Let's consider the cost in real dollars of bringing them up to 20wpm (nowhere near the bit rate available via dsp, but I'll go easy on you).

>With your choice, the CW contact is not possible, and the challange is
>not fair.

Your choice requires time (and therefore money) which results in a skill that is less efficient. Who's being unfair here?

Well, let's see here. I had just turned 23 when I saw W3IWI and N4HY demo some of their DSP stuff at an AMSAT get-together. All I would have had to do was 1) obtain one of the TI DSP boards and plug it into a PC (something I've been doing since I was about 15), and 2) Copy some floppies (again, something I've been capable of since the days of the S100 beast).

The best part is that I could get college credit for putting this sort of thing together, something that CW can't buy. Not to mention a superior signal interception system, with far greater sensitivity, speed, and spectrum efficiency.

>This body of knowledge is
>considerable, as demonstrated by the fact that most electrical
>engineers with a bachelor's degree are probably not comfortable with it.

A gross overgeneralization. Stanford recently converted its intro-to-DSP course to an undergraduate junior level course. Marquette also offerred an undergrad course, and it was always packed. Since both of these courses are optional, their popularity demonstrates that DSP not only simple, but considered to be very important, even by "youngsters".

Sorry, but CW is not cost effective.

9600 BAUD (BPS) FAX TEST RESULTS

Conducted between WB8WKA (NOS TCP/IP) and WA8OOH (MSYS v1.08)

(Please reference my earlier posting "9600 baud FAX MODEM" for a more detailed description of the circuit.)

Between 7/25/90 and 8/6/90, the amateur radio stations of WB8WKA and WA8OOH tested a "V.29 FAX modem" chip, the YAMAHA 7109, between there respective packet radio stations. Distances involved where about 7-8 miles over urban terrain. Results where quite positive with respect to the performance of the radio link. Equipment and power levels used at each station follow:

RADIO EQUIPMENT:

WA8OOH	WB8WKA
Livonia MI	Farmington MI
ICOM28A (5 watts)	KENWOOD 7950+amp (160watts)
MFJ 1270 TNC	GLB TNC2A
MSYS V1.08 on IBM AT	NOS on IBM AT

Additional radios where also tested. At WA8OOH, good results where also obtained with a 215 Kenwood HT at 200-300 milliwatts. A Kenwood 7730 was also tested with very poor results. Past experience with this radio and the failure of any PL to function correctly on it may need further investigation.

At WB8WKA, tests where also run at power levels less then 160 watts with excellent results, but due to the sharing of the radio with one of the Detroit/Windsor TCP/IP lan's, running lower power full time was not practical. In addition, a ICOM 2AT was tested at 100mw with excellent results.

Signal strengths at both stations where full scale, even at lower power levels. Antennas used at WB8WKA consisted of a AEA ISOPOLE at 50' while at WA8OOH we had a Hustler G7 at 20 feet. All tests where conducted on 2 meters.

THROUGHPUT:

As was to be expected, throughput took a dramatic step up. About one megabyte of files where moved via tcp/ip, with the throughput hovering around 100 bytes/sec. While this is certainly nowhere near "9600 baud", it was a significant jump over earlier tcp/ip testing at 1200 baud. It is thought that there may be some incompatibilities between msys tcp/ip and net/nos. Tests will be run latter this week between two msys stations to see if this figure can be improved upon.

In AX.25 operations, ("user" to bbs) operation was simply put, a dream. By using the "XF" command in msys, full packets where transferred. Setting "X22" allowed a full screen to be transferred at a time. Throughput was about 1 page a second, which worked out to be about 6000-8000 bits per second. From a "user" perspective (I was the user in this case) it made operating the bbs much more enjoyable. As many of our LAN's in the southeastern MI area our crowded, the additional speed did not go to waste.

If I may quote WA4DSY, "Oh where oh where is my HIGH SPEED DIGITAL"? What this means of course, is that we where not able to fully exercise the modems due to MSYS and/or our TNC's not being able to go beyond 9600 baud. The tnc's where modified for 19200 baud operations but we experienced dropped characters. In any type of KISS operation, it is important for maximum throughput, that your DATA link (async link) be at least twice as fast as your radio link. As we where not able to achieve this, then our hope is that much faster throughput can be obtained.

GENERAL IMPRESSIONS:

Audio setup is much more critical. Tones will tend to sound undermodulated. In addition to audio setup, a "keyup delay" circuit must be setup as well. This is due to the fact that these modems send a "training sequence" upon keyup. This must be held off until the radio is fully keyed up. (generally 100-200ms) Once these parameters are set up, things seem to be fairly stable and the modems can be relied upon in day to day operations.

IMPROVEMENTS:

A easier method for tuneup needs to be developed. If possible, mounting inside the TNC would also help. Current carrier detect in YAMAHA chip is useless. Have been unable to get state machine DCD to work on this chip but it is what is needed. Current layout use's +-5V, this needs to go. Must run on only +5V. Also will add programming header and mode select DIP switch.

Existing PC (a carbon copy of the PRUG circuit board) needs to be improved. Quite a bit of digital noise exists on this chip and a re-layout of the PC board would help greatly.

THOUGHTS:

While my original idea of the use of this modem was "networking", more and more I am beginning to feel this will be the next step for the end user. In many applications such as the DX cluster, TCP/IP and bbs operation, increase of speed on the user LAN is becoming more important. While this modem should be a fine performer on our "network backbones", the ease of implementation and the fact that IT CAN BE USED ON EXISTING RADIOS UNMODIFIED should be quite appealing for the amateur that wishes to increase LAN throughput.

WHATS NEXT:

In the next week or two, I need to re-layout out the circuit board to include the improvements I have found. In addition, I DESPERATELY need schematics for TNC's. I have schematics so far for the TNC1, TNC2, PK232 and DRSI. If you have schematics for any *other* tnc, PLEASE send me a copy to the address below:

Jeff King WB8WKA
22816 Maple Ave
Farmington, MI 48336.

Also, if you would like copies of the article describing this chip, please send a SASE to me at the above address.

BETA TEST:

So far, about 16 people have expressed interest in participating in a beta test of this modem. What this basically means, is that we will all get together and make a group buy of parts and such to reduce our costs. In addition of course to the sharing of information that a beta test implies. With a professionally done PC board and all parts I expect costs to be on the order of 60-70 dollars. This is of course assuming we can get a decent discount of the YM7109 (fax chip) as it alone goes for $55!!

73's

Hmmmm. I don't know about this. I'm *sure* every 15 year old techno-whiz knows enough calculus to work through the DSP design equations :-) RIIIIIIGHT! Sure, the coding is simple enough IF THE DESIGN IS WORKED OUT AND EXPLAINED WELL ENOUGH, but where is this information available in a form that the average 15 year old can UNDERSTAND???

I have to agree with Ken about the effectiveness of CW as a weak signal medium at VHF/UHF/SHF, when there is a human on both ends of the equipment. However, with computers on both ends of the circuit, this no longer holds.

As far as protecting the weak signal portions of the bands from the communicators, remember, we have CW only subbands on most of the vhf/uhf bands. IF YOU DON'T LIKE PHONE OPS WORKING WEAK SIGNAL, STAY IN THE CW SUBBANDS!!! I seriously doubt that all that many communicators are going to be interested in weak signal anyhow. I think they'll be too busy yaking on a repeater or working packet to care much about us folk who dig the weak ones out of the noise (whether ssb or cw!!!)!

If CW is that essential, why don't you let people discover that for
themselves?
In the 8 years that I have my license, I felt absolutely no need for
CW - while building a SSB transceiver (just for the fun of it),
or while building small repeater hand-helds, smaller than commercial
ones available at that time (also, just for the fun of it), or for my
tons of other projects.

Once more, the exams are built in such a way that people can operate
(build, modify, repair) RF gear safely (thus know the harmfulness of
spurious frequencies, high power and the like), and let the rest
of skills develop by practice.

If someone wants to develop skills to build RF gear by himself (the
exams are NOT SUFFICIENT for that - some practice is required), that's
fine, he knows how to do that without disturbing neighbour's television.

If someone wants to work via satelites, that's fine. If he needs to learn about orbits to know where to aim his antenna at, let him find out!

If someone wants to operate RTTY, that's fine. If he needs to find out
you usually cannot run SSB finals on max power continiously, let him
sniff and find out. If he needs to learn how to type, let him find out.
Speedy typing is not required on the exams (however, if one looks at
some typing done on packet, maybe typing may be in the exams? JUST KIDDING :-)

If someone wants to develop skills to receive very weak, distant signals,
that's fine. If he needs to learn some encoding technique that may be
more efficient, let him find out, don't force it on the exams!

After all, the Amateur Service is a service of self-education, isn't it?
Learning by doing it, it's much more instructive, and certainly much more fun!

John could you possibly supply the algorithm for the technique of
encrpytion which you menyioned in your note. I think it would be
interesting to start getting some algorithm ideas happening.

The latest word on the NJ Scanner Law is that it will not be considered
in the full assembly until after October, and probably November. Input
from Assemblyperson Marlene Lynch Ford is that the more letters the
Law and Public Safety Committee gets the more likely it will pass. This
is DEFINITELY still within grasp, so if you are interested in seeing this
pass WRITE or CALL NOW!!

NJ Law and Public Safety Committee members are:

I'd like to pose 3 questions to my fellow INFO-HAMS readers:

1.) Does anyone out there have a VAX VMS compatible program that will de-compress files, such as the archives of "INFO-HAMS"?

Brian Kantor has told me that the archives use a standard UNIX `compress' routine, and I'm hoping that it's a common enough protocol so that there'll be something similar in the `VMS World'.

```
2.) Are there some `VAX people' on the net who may know whether
    we have access to any DECUS (DEC Equip. User Group) files
    via InterNet? Now that I'm having some luck at using `ftp',
    it's getting a bit depressing to find that most of the files,
    that are available while using the "anonymous" UserID, are
    either UNIX or MSDOS-based routines. Surely (!) there MUST
    be some DEC VMS users `out there' (?).

3.) I've run across a few places that have Amiga Computer programs,
    and am wondering where there might be others? Suggestions
    would be appreciated.

Thanks,

Paul Nix (WB5AGF)    InterNet: nix%muppet.decnet@consrt.rok.com

I was listening to my newly crystalled Ten-Tec 580D yesterday, and I came
across a digital signal on 10.2808 MHz.  I hooked up my pk-232 and found
it to be a TDM (Time Division Multiplexed) 1:4 signal.  I sucessfully
decoded some information, (I don't want to divulge it's contents) but alas,
it was in French!  Does anyone know where this signal originates and to
whom it belongs?  If you have the proper equipment, it might be interesting
to listen to.  Any help will be greatly appreciated, thank you in advance.

Glad you like IT.

InstantTrack is not public domain. It is however available, for a small donation, from AMSAT. AMSAT is a non-profit, and mostly volunteer, organization that builds and launches amateur radio satellites.

Version 0.85 of InstantTrack is not a released version. It was a beta-test only version distributed to a limited number of people over a year ago. It should not be distributed, as the README file that comes with it clearly explains.

As for information: I suggest you call AMSAT, at 301-589-6062, and become a member. AMSAT's publications are one of the best sources of information about amateur radio related satellites. Purchase a copy of the released version of InstantTrack while you're on the phone. The documentation that comes with IT contains information on many more sources of info.

I agree with the first two, but I just cannot agree with the last.
The best way that I see to support my argument is for me to ask
you to listen to the general class portion of the 20M phone band
on Saturday afternoon. I rest my case.

Subj: No-code deja-vu

Phil Howard, still hammering on the code requirement, says that there are other reasons why people don't get into ham radio. He says that the CW requirement is the first big obstacle to be overcome. OK, let's identify some of the other big obstacles. What are they? Technical exams? Rules? Operating practices? Cost of equipment?

I stated once before, and I think it bears repeating: There are bigger reasons for yound people not getting into the hobby than CW. Today there are *many, many* more things for them to be interested in than there were, say, 30 years ago. There are loads of *affordable* options for entertaining hobbies, not the least of which is the TV set. Couple that with the "Nintendo" games. Add computer hobbying. For those who just want to chat, there's CB radio which has no licensing or entry requirements at all! Taken together (and there are certainly more pursuits), these account in large measure for the waning interest as *radio* as a hobby.

I agree with Phil that all the advertising in the world won't make many people buy something they don't want (actually, none will). But it is also true that if people really want something, they will work to get it.

I believe that if amateur radio has a problem with piqueing the interest of youngsters today, it has little to do with the licensing requirements. It has a lot to do with the options they have.

So, Phil, how about your list of things you believe to be big obstacles to entry into the hobby? Something other than CW for a change.

I have had trouble making my B&W AP-10 apartment antenna work on 40 meters. I can tune the resonantor to 1:1 SWR with my KW SUPERmatch antenna tuner, but the antenna radiates like a dummy load. Eight feet of wire stretched across the room loaded with the antenna tuner works way better. Ideas.

RTTY DX Notes for Weekending 10th August 1990.
Part 1 of 3.
BID: $RTDX0810

The question has arisen, how long is a long time before you receive your QSL card? Well if you are waiting for cards from a DXpedition who worked about 30 or 40,000 contacts, i would say that a wait of about 4 months would be a fair thing. But if you worked a DX station, well that waiting time would depend on the delivery of the logs to his QSL manager. And sometimes the postal service to outlandish places is very slow. But then of course there is the southwestern European station who tells everyone, if you want a QSL, please send green stamps, but he never sends QSL cards. There are all kinds around these days.

```
Our thanks this week go to G0ABI, I5FLN, I5ICY, I5IGQ, JA1BLV, OD5NG,
PA3DEB, TG9VT, UT5RP, VE3XJ, W2JGR, W6/G0AZT and the Tri-State DX
Association VHF packet cluster.  Thank you all for your assistance.

UA3PNN	14090	at	0340Z
UT5RP	14069	at	0345Z
UQ2HO	14089	at	0444Z

QSL Information:

J42DIO will QSL via SV2XYT, Box 10728, Tesaloniki, 54110 Greece.

R0L/UA6XGL QSL via RW3AH.

RC8O/UB4MZG goes to Box 22, Schastie, 348913, Ukaraine.

YS1RJ cards go to Box 792, San Salvador, El Salvador.

TK/DL7HZ cards go to his home address.

VP2V/JH4IFF collects his cards from his home address.

5N0ETP via W6QLQ.

EA9MY via Box 368 Melilla, Spain.

VQ9RB is via WA4DPU.

TU1UI will QSL via WA8ZWR.

TY1PS is Peter Schultz, BP 06-2535, Cotonou, Benin.

Notes Of Interest:

J42DIO is a special call to celebrate 2500 years of a holy city in Macedonia.

JA2NQD will operate from Belau as KC6CW from September 13th to 16th, then from Yap as V63AN from September 16th to 19th. QSL to Box 5, Ninomiya 259-01 Japan. While JH1BNL will operate from the same places at the same time with the calls of KC6DX and V63AR respectively. QSL his operation to Box 73, Okishu 431-31 Japan.

JG1NBD will sign S79 Seyschelles, from September 13th to 17th. QSL to his home call.

JH1QDB, Kuni will sign JD1 from September 23rd to 30th. QSL to his home call.

KU9C, Steve, states that he is willing to act as QSL manager, house keeper, for any RTTY DX station that needs a manager.

GL DE DX1 (VK2SG).

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU, or via AMTOR on the VK2AGE APLINK mailbox.

I found this in comp.dcom.telecom and received the author's permission to repost it to these groups. (He's on the fringes of Usenet and can't easily post items.) He asked me to mention that although he sometimes writes professionally on related subjects, this is just a quick sketch of personal recollections about these stations.

Direct replies should go to Don at his MCI Mail address.

Coastal Telegraph Stations [Donald E. Kimberlin]

Date: Thu, 9 Aug 90 09:16 EST
From: "Donald E. Kimberlin" <0004133373@mcimail.com>
Subject: Coastal Telegraph Stations
Organization: Telecommunications Network Architects, Safety Harbor, FL

In article <Digest v10, iss547>, Nigel Allen writes:

>Before INMARSAT began to provide satellite radio service to ships at
>sea, the only way to send a message to a ship was through a coastal
>radio station, either by voice or by telegraph. (I think that teletype
>service was available through Rogaland Radio in Norway, but not in
>North America.) INMARSAT is quite expensive ($12 per minute from
>Canada), but even so coastal radio stations are closing down in the
>U.S.

He further says:

>... Western Union has filed with the FCC to shut down its coastal
telegraph station KFS ... and that ... WPA, WOE, WMH, WSL and KOK
>have already been closed down. No doubt some traffic that formerly

>moved through these stations now uses cellular phones.

And he asks:

>Does anyone know whether there were competitive coastal telegraph
>stations in a given market, or whether such stations had a local
>monopoly?

Well, I have to say "thank you" to Nigel for raising a question near and dear to my heart that caused an excursion back to a comfortable past career. I was prompted to answer the question in part from my personal library and experience, but also to get on the phone to have a very pleasant chat with my old Almer Mater of international shortwave radio, WOM at Ft. Lauderdale, FL. Here's an attempt at summarizing a lot of detail:

While yes, it is true that shore telegraph stations are retiring from the airwaves, and significant shifts are occurring. Maritime Mobile Radio using Medium Frequency and High Frequency radio is, believe it or not, still growing, and MARISAT/INMARSAT are far from supplanting it. And this in spite of some incursions by cellular radio as well.

First, we must make it clear. Until or unless there comes to pass a global form of radiotelephony like Motorola's IRIDIUM proposal, there are vast stretches of ocean reached only by HF radio or INMARSAT. My phone inquiry to WOM found them very aware of these developments, revealing they found that while some ships, mostly supertankers, bought into INMARSAT, the $10 (U.S.) per minute rate compares poorly with the $4.90 per minute of HF radiotelephone, especially because INMARSAT bills from the moment of connection while High Seas (HF) radio makes all calls person-to-person and bills only when the conversation starts. Apparently shipping companies come to this conclusion when they get their bills, and find that a call to the ship's steward for a one-minute talk results in a $100 charge while they wait on hold for him to be paged to the satellite phone!

What the WOM folk knew was that satellite-equipped ships use INMARSAT for hard-copy communications, running not only Telex but even PC's at 64 kilobits off the ship. That's what's killing the shore telegraph stations.

They're not all dead however, just shrinking back to meet reduced demand. For that structural background Nigel asked about, shore radiotelegraph stations in the U.S. grew before there could be any structure to their sub-industry, mostly as "company" stations. For example, the origin of TRT Telecommunications, today in Washington, DC, was as a 1912 ship and shore radiotelegraph operation of the United Fruit Company in Boston, using 1912's "highest tech" to direct shiploads of bananas to the best markets while enroute.

That expanded to using radiotelegraph to the plantations in Central America, and that expanded to TRT becoming the international telegraph (and sometimes international telephone) company of much of Central

America; the entity on the other end of AT&T's point-to-point HF radiotelephone from the U.S. RCA, of course, made shipboard radios for many American-flag ships (remember that David Sarnoff, builder of the RCA empire, was first a Marconi Corp. ship's radio telegrapher.); the result was RCA building a string of shore telegraph stations for its customers. And, the RCA shore stations operated radioteletype as a service to promote sales of shipboard RTTY gear. ITT got into the act by owning Mackay Marine, which competed with RCA for maritime radio equipment and services, and so had a string of stations, too.

There was no territorial or service monopoly. In fact, just the opposite seems to have happened, and caused some significant words in the (U.S.) Communications Act of 1934, to the effect that (sic) radio stations for public correspondence must accept communications and traffic from any mobile station, because the "company" stations had, in fact, refused to answer calls from (even distressed) ships of other companies. What developed from that point was an interesting form of competition of many years' duration. The shore stations did compete with attempts at camraderie and service in ways only telegraphers could understand. Imagine if you can, an unseen, unheard person on shore exuding warmth and personality via a telegraph key ... and they did.

Despite the shrinkage of the number of radiotelegraph shore stations, the remaining ones seem to be enjoying growth by picking up the slack. For example, WPD at Tampa, FL seems to still be going strong, independently owned as it has always been, handing its traffic off as domestic telegram and Telex messages (that have now largely become E-Mail with PCs). One of the other "company stations" that never operated maritime traffic, the Trans-Liberia Radiotelegraph Company (built by Firestone solely to communicate with its plantations in Liberia) seems also to still be in business from Akron, Ohio ... but has been off HF radio for many years, and is now largely a message center with a couple of PCs ... but you could, if you wanted to, send a telegram to Liberia via Trans-Liberia!

As to the telephone business, INMARSAT, as noted, may have made some market, but it seems to be rather insignificant to WOM and it companions. Their market still grows. AT&T has operations at WOO near New York, WOM near Miami and KMI near San Francisco. The single most significant part of the traffic is cruise ships, that enjoy handsome profit margins on phone calls to shore for passengers. It's known that one cruise line tells passengers they are on satellite, and charges $30 per minute, while putting the calls on HF radio (yes, HF can sound mighty good, running SSB radio with Lincompex) where the shore station charges $4.90 less a $1 "commission" to the ship!

The surge of technology has helped, with $800 SSB transceivers, so that small ships and private yachts get on HF radiotelephone, too ... not wanting to pay the price of a satellite shipboard station and then the per-minute rates. They have fueled the surge in minutes, along with ... of all things ... aircraft! The WOM folks handle a fair amount of calls for private aircraft, notably some Venezuelan oil company planes that travel from South America across the Atlantic and Africa to Saudi Arabia. Some few "hep" international airline captains have even found their HF transceiver can get them a phone call to home while crossing the Pacific at 35,000 feet!

The result is that WOM alone of the three AT&T stations is handling about 700 revenue-producing calls a day. And, the traffic of the one privately-owned U.S. station for international telephone traffic, WLO at Mobile, Alabama seems to also be healthy.

The standards bodies seem to sense this growth, for in 1991, the channel assignments for HF maritime radiotelephone use will be restructured again, with narrower channel widths (2.8 kHz) to create more channels.

As mentioned earlier, the sub-industry is restructuring, in some cases with technology old-timers could never comprehend. A major change has been and continues toward automating and reducing overheads by consolidation. As I write this, work is underway to consolidate the control point for NY's WOO in the WOM control room at Fort Lauderdale. Similarly, the local telcos who always ran the medium-frequency (2 mHz) Coastal Harbor operations abandoned them with demonopolization, and WOM took over Miami, Jacksonville and Charleston, SC, running the whole works with the WOM callsign and 10KW transmitters, while the receivers along the shoreline are wired to Fort Lauderdale.

The communications technology behind it is in some ways awesome, in others what we should simply expect. The WOM location in Ft. Lauderdale is 50 miles from its transmitters in Pennsuco, west of Miami, while the actual landline telephone operators all the ships speak to are in Pittsburgh, Pennsylvania! Not such a feat when you find out that the building is also AT&T's fiber POP for Ft. Lauderdale and WOM enjoys its own whole fiber route direct to Pittsburgh! Meantime, control of the transmitters is by PC messages shot around AT&T's packet data net to turn a transmitter on or off or change its antenna ... no clunky old "control circuits" at all; instead messages from a 3B1 UNIX machine (yes, they are planning to get 3B2s) that go on a packet network to be read by similar machines with control interfaces at Pennsuco (and soon, Manahawkin, NJ for WOO ... with KMI's Dixon, CA transmitters a likely addition someday).

And, HF radiotelephone even has its disaster function. During Hurricane Hugo's trip through the Virgin Islands and Puerto Rico last year, the first restoration of telephone connections to the U.S. was from ship radiotelephones there to WOM for several days. Of course, the world gets little news from the networks about such undergirdings of telecommunications. If people had wanted, they could have as well made phone calls into the U.S. telephone network (and thus the world) via WOM in the Mexico City earthquakes. FCC rules do permit doing ANYTHING with a radio transmitter if it is for the safety of life and property ... but that doesn't mean calling to see if Uncle Fred's attic window got broken, it means serious PUBLIC safety.

Oh, the cellular incursion. Yes, it's there, but again not that significant to a growing market. First, cellular of course, reaches only incidentally a few miles offshore. There are automated VHF marine-band dialable shore stations that do reach seaward, but perhaps only 50 miles offshore. Run by a private company in Hollywood, FL, these similarly are remote controlled from that city, even though they range along the whole coast. And, in the Bahamas Islands group there are reported to be two cellular companies among the islands, Cruise-Phone and Boat-Phone. They serve an obvious purpose for boaters sailing among the thousands of Bahamas Islands, but only there.

Growth seems apparent in other areas, too. St.Thomas in the Virgin Islands has HF voice station WAH that is growing, as do several of the other nations' Caribbean islands ... French, Dutch, English and so on. And, of course, around the world, there are the established stations of many nations. The "territorial monopoly" is rather interesting when the Laws of Physics interfere. It's very difficult for nations to legislate what shore station a vessel calls ... even though some do force it economically, witness the Cuban shore stations with their own and Russian ships, plying the same waters, but never getting on the channels of the American stations, even though they easily can.

So, I hope this is the kind of response Nigel wanted. It's a peek into another galaxy of telecomm that most people don't even know exists or thinks is dead is the kind of response you wanted. From the figures I got today, it's another telecom business that grosses at least $15 million a year, and perhaps several times that.

And, since this peek got so long, here's a vignette learned yesterday from the WOM Technical Operator I chatted with. We were comparing stories about handling REAL emergency traffic, as anyone who has done that job has done, as he gave me a real side-splitter.

Seems he worked the third shift for a couple of years, and in the darkest hours of night, traffic tends to be nearly zero. However, one night at 3 AM, he heard a whispering voice on the speaker of his calling receiver saying, "Hello? Is anybody on here?" He lit up a transmitter and answered, whereupon the caller identifed himself as a ship and said, "We are under attack by the Indians!"

What? A ship at sea under Indian attack? What it turned out to be was s small freighter that had run aground on remote shoreline of Nicaragua, and the natives were boarding the ship and stealing everything in sight! Not daunted by this at all, the WOM T.O. called the U.S. Coast Guard District Office to find out what support was available, and within a short time the Nicaraguan National Guard was dispatched to quell the Indian uprising.

If you think, "Having that job must be a ball," you're absolutely right. Many is the time I've thought I should have stayed there. Pity it's only one that employs a handful of people. Oh, it's not a "secret" place although not in tour books. Located at the corner of

State Road 7 and Sunrise Boulevard in Fort Lauderdale, just look up AT&T Company and give 'em a ring if you want to visit!

[Moderator's Note: *Thank you* for a very interesting and informative article. I'm sure you are correct that this is a form of telecommunications very few people know anything about. I hope your article has educated a few of our readers today. PAT]

OK, I forgot that one. Actually I pulled up a list I made a few months ago for this, and that predated when you brought up your issue about the weak signal subbands and CW.

You say that morse code is essential for MOST weak signal communications at VHF. Do you know for a fact that MOST weak signal communications is

done in CW or are you trying to state that morse code is essential even
for those who operate only in SSB?

You say morse code is cost effective. Well I might very well have to agree
with you here. But tell me the justification of why we have to FORCE people
to use it, as opposed to letting them choose for themselves? Maybe I LIKE
to give lots of money to Japanese radio manufacturers.

A most apt .signature!! Maybe there are TWO PROBLEMS keeping out the young
and the innovative? Maybe there are MORE? I know that the requirement of
code for NON-code-related privileges is a big turn off. I also acknowledge
that other things can be concurrently causing the problem. In fact I am
sure there are other things.

The Morse code exam is not the only ill facing ham radio, it's just ONE.

If we do have a no-code license class, it is obvious we still won't get anyone into the hobby unless we go out and promote it. But at least with a no-code license, the (first) big obstacle is out of the way.

> let the lazy types in anyway, and then we'll look for other problems.

Why haven't we been doing this? Haven't we had the opportunity to do this over the many years since ham radio's "growth" has failed to keep pace with the population and use of the radio spectrum. Please read my other posting with the conversation script. The answer is that it is the CODE TEST that has been making it difficult to make ham radio attractive.

If you'd just stop claiming that the only reason people are not getting into ham radio is laziness (there are some of them, though) and start looking at the problem, you'd see that there are other reasons, and many of them as well. Try addressing THOSE issues. If you come up with different solutions, let us know.

All the advertising in the world won't make very many people buy a product they don't want.

About a couple of months ago, there were some postings in this group about the AEA IsoLoop antenna, pointing specially to the low quality of the review published in CQ Magazine. Now, does anybody have some first-hand data/operational experience/measurements, etc , such that to get some estimate of the real value of this antenna? I would appreciate some info on this subject.

Thanks in advance,

Avi - 4X6LP

I can uuencode the ZIP file, and then upload it to the newsgroup. However, the last time someone did this (LOGGER) there were some comments stating that these files shouldn't be distributed in the group. Who do I ask permission to send it via uuencoded messages?

The weak signal portion of the band includes TWO subbands:

1. The CW-only subband (50.0-50.1 and 144.0-144.1)

2. SSB and FM portions.

I will accept that CW skills are relevant for the CW-only portion since that
portion require you to ID in CW as well, and you had better be able to prove
that you can do it, even if your computer dies. But 5 WPM makes it legal.

But the real problem here is with the SSB and FM portions of the weak signal
bands. You keep CLAIMING that it is relevant, and you put forth only one
flimsy argument that operators in these bands need to be able to switch to
CW when you can no longer hear SSB through noise or distortion. This
argument falls apart when you are dealing with people who are motivated to
work weak signal operation in a particular emission mode.

My interest in working weak signal is in seeing how far I can carry voice
or video, NOT in seeing how far I can communicate at all. Granted, YOUR
interest appears to be in the latter. We should be trying to share the
spectrum together. But look at which ONE of is is trying to boot the other
out.

It very MUCH is a "not in my neighborhood" issue. This is EXACTLY what that
term means. You don't want them around you unless they CONFORM to YOUR
particular interests.

> I believe that amateurs should be tested on any modes and/or techniques
> that they are privileged to use. If you can use packet, or rtty, sstv,

> or atv., etc., then you should be tested on these subjects on the exam.

1. This is just not going to be practical. Because the number of areas is large and growing, the number of possible license classes to represent this is staggering. If you have just ONE class of license, and then have CW, packet, rtty, sstv, and atv, and endorsements, then you have 32 different combinations right there.

   The FCC has let it be known that whatever is done, it must work on their existing computer system. That system is programmed to handle 6 different classes and has NO scheme for any sort of endorsements.

2. The fundamental PRIVILEGE is the right to use a radio frequency. If radio worked in such a way that no one could possibly interfere with anyone else, we would not need licenses, or even the FCC. HOW we use that spectrum privilege is really not at issue to WHY we are licensed. A radio signal can potentially cause interference whether it is CW, packet, sstv, SSB, or whatever. Testing people on such things as how TV works, or what packets are, has nothing to do with being able to share the spectrum. These tests are just as irrelevant as the code test. Testing should be strictly limited to fundamentals of radio communication, and be done thoroughly.

While any lawsuit is a serious situation, as Jay points out, this particular case is not exactly typical of the kind of lawsuits I have been hearing might be used as a threat against a coordination group.

First of all, there is a real deterrent here, and that is the deterrent to PUBLISH. This guy technically was not suing you for your role as a coordinator, but rather for your role as a publisher, and then using that suit as a means to try to get something out of you in your role as a coordinator.

> Damages? They can sue for every asset the organization, and its
> individual coordinator(s), have, on the premise that we damaged his
> reputation. The plaintiff in our lawsuit left damages to be soecified at
> the trial, but claimed that we had irreparably harmed his business.

Was the Texas VHF-FM Society incorporated? Every group should be.

What "business" did he claim was harmed? I'm curious.

> Relief? He can demand that the coordinator do things his way.

Even if you were found guilty of libel, I don't see how he can demand that your role as a coordinator, and the public trust in it, be usurped by him for "relief". Relief would be in the form of a retraction, and whatever real damages are caused.

> John's right. Being sued is no picnic. It brought almost all of our

> since the plaintiff had little in the way of assets - he had to change
> lawyers once during the progress of the suit because his first lawyer
> hadn't been paid.

What was the outcome of this lawsuit? If this guy had little assets, then what was this "business"? Surely not his repeater?

> Yes, the threat of being sued is a credible deterrent, whether Phil
> thinks it's a copout or not.

I don't deny that it is credible. The copout is when we do absolutely nothing but bow to all threats. At that time, we no longer are making out own decisions, but rather, someone else is making them for us. The problem needs to be worked out.

First of all, I would suggest that a coordination group:

1. Have absolutely NO other interests or positions on anything. If you publish anything, limit it to strictly the issue your organization deals with (coordinating). Don't get into the spectrum planning business. Let that be another organization.

2. Be incorporated in the state you operate in, and limit your coordinations to within that state.

3. Allow anyone with a genuine interest to always work within the organization.

4. By all means make sure the organization retains an attorney or two.

Much as I try not to slow down on a highway when passing an accident, I've been trying not to add to the noise in the on-going, very low SNR code/no-code debate. However, K5ZC has recently made some telling remarks that hit my hot button: from the ham as a hobbyist perspective (not as a magazine distributor, national dues charging organization, or any other perspective that will profit from more hams), it looks like we need to decrease the average age of the ham population more than we need to increase the size of the population.

Why? Mainly to assure that in 35 years, when today's average 49 year old hams are croaking left and right, that the hobby that has been a big part of many our lives continues on. No other real reason, though I think it is a lot more fun talking to a 16 year old who is at a high school station than to a 85 year old at a retirement home.

Due to its use of the spectrum, ham radio will and should have barriers to entry. I personally think code is the least difficult of the barriers for primary school age kids to hurdle. I give ham radio presentations to Cub Scouts each year for their communicator badges (how apt!), and they generally are more turned off at a school-like written test than they are at learning code. Most of the people who are turned off by learning code would also have a problem learning a second language; most of the kids of the age that we need to attract to the hobby can pick up Spanish as easily as code.

I was opposed to no-code licensing for the same reason I am opposed to the capital gains tax reduction (pretty deep, huh?): they are both short term fixes applied to long term problems. However, I've sorta changed my mind on the communicator class license. It will probably help to keep us from losing more VHF spectrum, and my morning drive time show group can always go back to 10 FM for commuting blathering if VHF gets out of hand.

But, I am worried that if the new license does lead to an increased ham population we will lose sight of the long term issue of attracting young hams. KE3Z, if you do circulate any of these missives around HQ, I'm afraid the ARRL in particular will forget about the long term problem during the short term euphoria of increased QST subcriptions. When the league committee was working up its position, I send W2GD a note to the effect that no-code wasn't the solution to attracting younger hams, and maybe the league should spend a lot more time sponsoring high school stations and marketing amateur radio towards teens and pre-teens.

Marketing is the key. Apple has done a great job of getting its computers in front of rug-rats who will be decison makers before long. Amateur radio should do the same.

Hey, you guys (generic, non-sexual term) out there who work at game companies: how about a Dr. DX NINTENDO game? My son could learn CW in two days if he had to learn a character to get extra lives in each level of Super Mario Bros 3.

I was able to snarf the mininec3 program via anonymous ftp.
However, there is no user's manual. Anyone know where I can
obtain a user's manual for this? Thanks in advance.

Attention radio shoppers..... Kenwood announced that they are begining a phase
out of the venerable TS-940. No real replacement in that price range
announced. They may not be planning anything in that range assuming that the
950 will pick up the slack. Also the TM-231, 431, 531 are being discontinued
in favor of new models. See QST.

Kenwood also announced a new ultra small HT that looks like a "Space
Communicator". More to follow later......

From what I have seen it appears that Nintendo is more fun than Ham Radio.
Kids are NOT going to get interested in Ham Radio unless we have something
which will get, keep and focus their attention. How many kids are still
interested in computer hacking anymore? My guess is that the number is
a lot smaller than 5 to 7 years ago; again, it's a matter of capturing
their attention and we don't have that pearl yet.

...and if we promoted ham radio properly, people would want to get into it badly enough that they'd want to learn the code.

This is the fundamental impasse. You claim that your buddy won't get into ham radio because of the code requirement; I see it as he hasn't been properly sold on the whole hobby. I seriously doubt that either one of us will change the other's mind. Unfortunately, the FCC is on your side, and will ignore anything I have to say on the subject. I didn't even bother sending in comments on the NPRM, since they'd just be ignored.

I grieve for what ham radio can be, and what it will become.

The LM386 is made by National Semiconductor. You can get all
the info you need for the National Linear IC Data book. Ask
your local National distributor for a copy.

I have actually been to their store in Preston en route between Colorado
Springs to Boise. It is a downtown storefront in Preston and they do seem
to maintain a large stock of things. They seem to be legitimate.

Richard,

I'm pretty sure that Signal One has been out of business for something like 10 years. There are a couple folks who service the rigs but the original company is no longer around. If I remember correctly they produced to rigs..the CX-7, then the CX-11. I'd guess the CX-11 was introduced somewhere around 1977. The rig was quite an innovation for its time, and so was the price tag...it has that in common with the IC781 too ;-)

Good idea Jim. I have now renamed the concept E-QSL or "Electronic QSL". I beleive
that you are right about RS/RST. It seems to me that
amateurs are supposed to experiment with new communication concepts. If
this can get off the ground it might prove interesting. All we need now
is to have some help from a DXpedition and an awarding agency. Also,
there has to be some work done to develop a public domain aglorithm
which can be used. I guess it will also have to certified by an awards
group. Keep your ideas coming.

I'm looking in the National Semiconductor linear catalog and I see that the LM386-1 is rated at 250mW,min and 325mW,typ ... now there is an LM386-3 that will go: 500mW,min and 700mW,typ. That might be one solution.

Another might be to check pins 1 and 8 to see if there is an electrolytic capacitor attached. A 10uF cap here will increase the voltage gain from 20 (nothing connected) to 200 (10uF). Note that increasing the audio gain means a decrease in battery life.

I don't know which version radio shack is selling, but it might pay to go in there and look at the actual device (magnifying glass may be required!).

Great ideas doug. I sure think the idea of DXpeditions sending their computer logs to award agency to be used for conformation is excellent. Also you idea of perhaps having a 'clearing house' which supports many expeditions and rare dx locations which would provide you with a official

confirmation list of you contacts for a small fee is good.
Still I think that experimenting with E-QSL's would be fun. You may be
right about legality of encoding a number - however with the support of
the ARRL/IARU and others this matter could be addressed - successfully,
I think?
Still I think that it may take some time to figure out a suitable
public domain encryption algorithm which will be FAST even on fairly
slow machines will take some time. Then there is the matter of convincing a
DXpedition to take the risk of trying out the idea
will be a separate matter. I suspect that they would have to
solicit the help of a number of Ham Mag's to feature articles which
outline what they are doing. This would mean plenty of forward planning. I sure
would like to hear more of your ideas.

Perhaps a 64 bit encipher coded is not need to E-QSL - Electronic QSL's got an ideas?
I suspect that the level of security required to make an E-QSL
confirmation good enough for an award would be minimal. Perhaps
a 16 bit encipher code would be adequate. It would run faster and be
shorter to send.

I worked for Drake from 1976-1979. At that time, they were still
manufacturing ham equipment. The competition from the Japanese was

intense, but they were still making a modest profit.

Not long after I left, they decided to ratchet up the profit margin by dumping Amateur Radio and going into the Satellite TV Receiver business. They were quite successful at it.

Last I heard, that's what they are still doing. They do still service the old ham gear. Prices are fair and service is good, from what I hear.

If only third-mates could pilot tankers, maybe 5-million-plus gallons of oil wouldn't be missing at the bottom of the Valdez bay. :-)

When I was in my teens, I learned how to pilot a ship. That knowledge is fairly useless to me here in Colorado. But what the hey, most things in life are useless or unrelated -- at least that's what people often say.

Hmmm, I do know how to ride a horse, maybe next summer I should learn how to hitch a team. Oh no, I just remembered, I don't like picking their hooves, yea that's right, picking the rocks and stuff from their hooves before riding is a real pain. Yea, there should be a no-pick license for horse-back riding. Yea, that's the ticket :-)

Mr. Bloom,
If you read my posting carefully you will see that I did not say
emergency communication had been removed. I said education and training
are part of international documents. Seeing as you want to put words in
my mouth, I will add that I am not aware that emergency comms are
mentioned in international docs. But you would know all that, because
you have access to a library that my fees pay for.

While I have your attention, let me say that I do not appreciate your
snide comments to me on an open forum. Also I am somewhat annoyed that
I should have to put up with impertinence from someone who is an
employee of an organisation that I support with my fees.

disappointedly yours.

At least there are folks out there, Jay, that not only realize there are problems but are trying to solve them. No-code won't solve all of Amateur's ills by a long shot. There's no quick fix for years of neglect. But it's a start.

In a previous message, Richard Harel (4X1DA) mentioned that he had seen at Dayton this year "an HF xcvr which was strikingly similar to the ICOM IC-781". From his next comment, it's obvious that the radio had a Signal One name-tag on it.

I must have seen the same radio; Richard's comments reminded me that, at Dayton this year, my eye had also been caught by what appeared to be an IC-781 in Signal One clothing.

I stopped at Signal One's booth and chatted for a few minutes with the fellow manning it. As best I can remember, what we saw was (for the most part) a repackaged IC-781, that Signal One had contracted for Icom to produce, although I was given to understand that Signal One had Icom code some different software into the machine. I can't remember what (if any) hardware differences there were, between the Signal One version and the IC-781.

The radio was being built in very limited quantities, for some particular application. My recollection is that Signal One had the radio on display more as a `conversation piece', rather than trying to market it to Hamvention attendees. I believe it's price was somewhere in the $15K - $20K range.

Some people. More people. Enough people?

>This is the fundamental impasse. You claim that your buddy won't get
>into ham radio because of the code requirement; I see it as he hasn't
>been properly sold on the whole hobby.

Let's take another example. Me. I've been proslytized by some of the best. My radio and TV instructor in college for one. Extra class. Meteor bouncer. Liked to play the world with 100 watts or less. He set up a special novice license class at the school. I'd finished the technical aspects and was at 2WPM when I decided it wasn't worth learning code -- I was having too much fun DXing my shortwave. That was Good Enough for me. Still is. (that was in 1980, by the way. I might point out that less than 50% of the people that started the class finished it. Of 24 folks, 11 got novice tickets, and 13 gave up partway through. 12 of those 13 gave up over code. Code was a problem 10 years ago...).

I've been proslytized since. The folks here at Apple are very open and very positive (Hi, Patty!). Phil and Bob Parnass and many of the folks here on the net set very good examples for Amateur behavior. That's nice. If the code requirement didn't exist, I'd consider joining up.

I bring this up because I am SICK AND TIRED of being called lazy. I am sick and tired of people saying that those of us who haven't learned code are lazy (or stupid, or pick your favorite attitude). I am sick and tired of being told that SWL is a second-rate hobby for folks who can't 'hack' being hams. Remember the SWL wars here before rec.radio.shortwave? Talk about proslytizing the hobby. For every Patty or Phil, there are a number of people who make Ham Radio seem about as interesting as boot camp. The *one* time I was stupid enough to walk into a Ham Radio Outlet here in the Bay Area was more than enough -- as soon as they found out I didn't have a ticket they were downright rude. If I'd been looking for help on getting a novice ticket, that would have been enough to convince me against it. I've listened to 2 Meter. I've listened to a number of the bands. Most of the time, it's rather hard to tell the difference between the annointed hams and the lowly CBers -- lots of noisy, hassling, USENET-like moaning. I should work hard to join up the flame wars that I hear out there? Like, what do I get out there that I don't already get here?

I'm not lazy. I was a month from finishing my code requirement. I could have done it -- I chose not to, and so did 50% of the class I was in. This was a class with a very good and motivating teacher. I can only imagine how well ham radio does under other circumstances (actually, from the statistics, I SEE how well it does).

Amateur radio has a LOT of problems. Code is just one. Worse, it is an arbitrary, unnecessary barrier. Hams should be worried about the state of Amateur radio. Instead, many spend a lot of time building silly, unrealistic excuses about why people don't join up -- if I knew nothing about Ham, I'd think many of them were talking about some kind of mystical religion.

Getting rid of the code barrier is just the first step. That removes that massive psychic wall from around the hobby. Once that's gone, it'll be MUCH easier to convince people to try the hobby -- if you go out and do a good job of convincing. If you don't, you can all sit around and continue making snide comments about us lazy twits who won't join and feel superior to us all you want -- until the hobby withers away and dies from lack of care.

Write me off if you want, Jay -- but I'm the kind of person Amateur radio should be trying to attract. It HAS tried to attract me multiple times and it's come close. But it's also successfully convinced me to spend my time and money and energy elsewhere because of all the hassles and the problems and the attitudes.

My opinion, as an outsider looking in (and as an interested and informed layman) is this: there are LOTS of problems in Amateur. Code is simply one. If all of the problems -- the attitudes and etc -- were magically fixed tomorrow, I'd probably think about learning code anyway. We know that's not even remotely possible. Removing code, however, drops a major barrier that makes the other problems more tolerable -- I'm not going to learn code to get into the problems, but I might choose to tolerate the problems to get to the good parts -- if code wasn't in the way.

There are good sides and bad sides to Amateur. Right now, frankly, the dark side is winning. No-code doesn't change that fight in any way, shape or form. It simply means that I no longer have to climb a cliff simply to get in the fight. Right now, the climb is steep enough that I'm letting the battle rage without me.

You're treating a symptom and not a disease here. By trying to 'beat' computer games on their own ground, all you'll ever be is a second-rate computer game.

The trick is to not try to compete with computer games by being one, but by convincing people that your own game is even better -- being a Ham. So far, hams have done a pretty poor job of that.

If you're born a banana, you'll never succeed by trying to be a peach -- you'll only be a horrible peach. Better to be the best damn banana in the bunch and convince people that bananas are better.

I think you may be on to something here. Perhaps the thing we need to get young people into ham radio is a distributed, virtual-reality gaming system done via packet radio. Nintendo and Mattel are doing well with regard to commercializing the VR stuff. If we could produce multiplayer gaming systems that connected via ham radio packet nets, I'd bet it would be hard to pry kids away. Witness the interest in multiplayer games on CompuServe.

To keep up the technical aspect, probably the right approach would be to define a multiplayer gaming packet protocol and distribute some sample characters or simulations that any ham could use along with source code. Publish it only on ham bboards at first so that kids become hams before they get access (you want to watch out for kids wanting to jump on without getting their license first).
Kids could then hack the code and try to improve their systems. Of course, some improvements would only be possible with more bandwidth, so some would move up in frequency into microwaves and above. Repeaters and repeater nets dedicated to gaming might result. Come to think of it, if this became popular, it might start crowding voice and normal packet. Hmmm.

Still, this is the sort of application that shows what can be done with computer-to-computer communication and a good multicast medium. And while it is very different from DX, it is very definitely recreational and noncommercial. Sort of like contests with a different thrust.

John, I have been copying the telemetry regularly, and several days ago
a text bulletin was included saying that the voice stuff was pretty close
at hand, and that dove might be off for a while during uploading of the
software.

If you'd like to see some of the telemetry, email me personally, and I'll
send you 20-30k of data.

Drake is still in business, but they no longer manufacture ham equipment. I believe that they mostly build satellite (TVRO) receivers and related hardware now. I know that a couple of years ago they were still offering repair service on the ham gear because a friend of mine sent them an R-4B to be overhauled and aligned. They charged some set fee (eg $100) and did a good quick job. I don't know if this service is still being offered or not. Drake gear is still a pretty good buy from what I've seen.

I enjoyed this article tremendously. Thanks to all involved.

It got me to wondering if anyone is familiar with the SITOR and other radioteleprinter fields. I sure would enjoy reading a technical discussion about this.   Any takers?

\>You say that morse code is essential for MOST weak signal communications
\>at VHF. Do you know for a fact that MOST weak signal communications is
\>done in CW or are you trying to state that morse code is essential even
\>for those who operate only in SSB?

If you're only having a pleasant chat with your buddies in the next state only 300 or so miles away, then SSB is usually effective, and it is usually used. However, if you are really pushing it, if you are trying to work a new grid, a new state, someone very far away, if band conditions are poor, or if band conditions are good but the station is so far away that the signals are almost buried in the noise, then CW is essential! I am arguing that since the whole point of weak signal communications at VHF and above is breaking records and pushing the state of the art, that CW should be required of all licensees that are permitted to operate in this section of the band. It is a very useful skill (indeed - here it is ESSENTIAL), and reasonable proficiency (~13 wpm) should be absolutely required.

\>You say morse code is cost effective. Well I might very well have to agree
\>with you here. But tell me the justification of why we have to FORCE people

>to use it, as opposed to letting them choose for themselves? Maybe I LIKE
>to give lots of money to Japanese radio manufacturers.

Cost effectiveness is not a justification for the CW requirement being
levied upon licensees granted access to the weak signal portions of the
VHF/UHF/SHF/EHF/etc. bands. It is just additional information that is
relevant to the discussion at hand.

In article <43943@apple.Apple.COM> kchen@Apple.COM (Kok Chen) writes:
>So, tell me, how does "your" youngster make his contacts? Why is
>it that "mine" would have to build his or her own rig and yours simply
>go off and operate right after he has learned Morse?

Your youngster doesn't have to build his radio, just his DSP equipment.
Oh, he has to write his own software also. If it will make you feel
beter, I will have my youngster build a morse code key. Commercially
available radios and transverters do not come equiped with either morse
code keys, nor DSP equipment (for receiving very weak signals at very
low baud rates).

>Moreover, you sure chose an arbitrary SNR, didn't you? Want to
>change that to -10 db SNR over a 100 Hz bandwidth and see who gets
>there first?

It was not completely arbitrary. I chose it such that contacts would
not be possible using conventional voice modes like SSB, AM, FM, or ACSB,
and such that contacts would be possible by both CW and DSP techniques.
With your choice, the CW contact is not possible, and the challange is
not fair.

This whole thing is ludicrous. My whole point is that with conventional (readily available) equipment and techniques, CW is indispensible for making weak signal contacts. It is the most cost effective mode with any equipment and/or technique. When CW is not possible, because the signal is below the noise floor, then other techniques should be used. I am not arguing against these techniques; I am only arguing in favour of CW, because of it's simplicity, because of it's great capability, because it is required for most VHF/UHF/EHF/SHF weak signal work, because of it's economy, and because it is very easy to learn. In my mind, CW seems to have a lot going for it.

I have to admit, that when I was first licensed, I thought I would never use CW. I didn't want to learn it. After I got on the air and became proficient (it took about 2 weeks at W8YY, the club station at Mich. Tech. Univ. to get up to about 10 wpm, and another 2 weeks to get up to about 20 wpm), and after I learned how valuable the skill which I acquired was, I changed my mind about the idea of a no-code license.

I am very opposed to allowing the no-coders into the weak signal portion of the VHF/UHF/SHF/EHF bands. It is obvious to me that CW will continue to be used for a very long time, even when the DSP equipment becomes available. I have a feeling that in addition to accurate clocks, good frequency stability will be required. When you're really pushing it, like 76 GHz for example, frequency stability is very hard to come by. On the other hand, it is much easier to generate a signal up there, and to generate a signal at 66 GHz (for example) to mix the received signal down to 10 GHz (for example) where you can work with it. While the stability required for CW will be possible, I doubt that the stability for your DSP techiques will be.

THOUGHTS ON LICENSING

Full credit for this licensing plan is from
WA2DYA with my full agreement. Simple is best.

Have 3 yes only 3 license classes as follows:

   Novice: Same as now - no change

   Communicator: No CW test , operation on 50 MHz and up - new

   General: 13 WPM CW test plus theory, all bands all modes-

modification to existing class

>> A LICENSE in the first place.

>It is OBVIOUSLY RELEVANT for any license that grants privelege to
>operate in the weak signal portion of the band. Hence, my comments to
>the FCC regarding their ill advised no-code license, in which I urge

Somewhere along the way, my comment regarding typing skills and RTTY was
deleted - so I'll ask the same question in a different way. Of all the
possible operating modes, CW is the *ONLY* one in which applicants are
expected to demonstrate proficiency. Why? You'd have me believe that it's
to guarantee that those operating in the "weak signal portion of the band"
are competent with a key, but I see no reason to believe this - nor do I hear
any reasons on the air. Getting a ham license presently means that a person,
at least at one time, could copy code reasonably well and send likewise.
It by no means guarantees that, once on the air, the licensee will continue
to do so, and it by no means guarantees that the licensee will use his
privileges in ANY mode in a competent and courteous manner. So why do we
single out CW proficiency as the one important factor to test in a new

applicant? I certainly can't justify the practice simply on your desire to cut down on the number of (in your opinion) lids in your favorite slice of the spectrum, especially as there's no reason to believe that the current licensing structure achieves this goal. (If a person really wants to play in the "weak signal/CW" zone, don't you think that they're going to try to operate in a proper manner anyway? And the ones who DON'T care - do you really think that the code test will stop 'em? Is CW some magic test for operators who are "pure and righteous?")

I'll repeat my original example. Say I'm a RTTY fanatic, and I'm fed up with hunt-and-peck artists clogging up the airwaves, leaving no room for me and my buddies to exchange 60 WPM QSOs. Now, using your reasoning, why shouldn't I ask the FCC to require a typing proficiency test of all applicants? After all, they'll have the privileges to operate RIGHT ALONGSIDE OF ME!!! HORRORS!

(I could be nastier and point out that I could grab a $99.95 computer and a decent CW program, and get right into the "weak signal" realm with the best of you - and not even know a lick of CW myself! Why not? Now, if you want to argue against machines taking over the time-honored CW reception chores, then I'll come right back and suggest that we should all be required to copy RTTY or SSTV *by EAR*. Hey, why not?)

I have written a new database program for DXers and other people interested in HF operating called DX Tracker. A demo version of DX Tracker is available from the comp.binaries.ibm.pc net. If you are not familiar with downloading utilities from this net it can be a little confusing. If you can't find anyone at your site who has done it before, send me email and I'll try to help out. As you can tell, this program runs on an IBM PC/XT/AT.

DX Tracker is not a logging or contesting program. It provides many useful statistics for those folks interested in 5BDXCC or 5BWAZ. It is pull-down menu and window driven and allows you to track your country/zone count on CW/SSB for 160-10 meters and much more. Give it a try and see how you like it.

There is nothing implied in my statement about the initial costs of learning CW! It only refers to making weak signal contacts on the VHF (and above) bands with current equipment and techniques. You are reading something into my statement that isn't there.

Even though I consider "counting the cost" of initially learning CW ludicrous, let me propose a challenge based upon my interpretation of your above statement:

I take one suitably willing 15-25 year old, and teach him CW. Then he makes a simulated contact where a CW signal is only 0.1 dB above the noise floor of the receiver with 2.5 kHz bandwidth.

You take one suitably willing 15-25 year old, teach him all he needs to know about DSP, have him build his DSP equipment, and then make the simulated contact. You can change the bandwidth of the receiver, but then the signal-to-noise ratio of the simulated signal must be scaled appropriately. (I was very generous when I gave you 2.5 kHz!)

Simulated contacts will be used to keep everything on level ground.

My student will be done in short order, while yours will be busy for quite a long time. My point is that if you are going to consider the costs of initially learning CW (which aren't that great - about 15 minutes each day for 2-3 weeks), then you must also consider the costs of learning all of that DSP technology. This body of knowledge is considerable, as demonstrated by the fact that most electrical engineers with a bachelor's degree are probably not comfortable with it.

I will repeat my statement, with emphasis to make sure you understand:
Morse code is essential for most weak signal communications at VHF and above, WITH CURRENT EQUIPMENT AND TECHNIQUES. It's also the most cost effective weak signal communications mode with any

equipment and/or technique.

-I'm looking in the National Semiconductor linear catalog and I see that
-the LM386-1 is rated at 250mW,min and 325mW,typ ... now there is an
-LM386-3 that will go: 500mW,min and 700mW,typ. That might be one solution.
-
-Another might be to check pins 1 and 8 to see if there is an electrolytic
-capacitor attached. A 10uF cap here will increase the voltage gain from
-20 (nothing connected) to 200 (10uF). Note that increasing the audio gain
-means a decrease in battery life.

According to the service manual for the PRO-34, they are using the
LM386-1, and have a 2.2uF cap between 1 and 8. If I get a chance,
I may try changing both the chip (to the -3 version) and the cap to
10 uF.

If you own any RS scanners, it is a good idea to get the service manual.
Any store can special-order it for around $10 - $15, and it includes
schematics, board layouts and alignment instructions. (Actually, I
believe you can get service manuals for almost anything they sell...)

So, tell me, how does "your" youngster make his contacts? Why is it that "mine" would have to build his or her own rig and yours simply go off and operate right after he has learned Morse?

In a very short time when (not "if", but "when") DSP proliferates in the Amateur community, "my" youngster can become an appliance operator too, and get on the air just as quickly as yours can.

Look, if "your" youngster wants to do marginal SNR CW, he can go learn Morse to his heart's content. No one is stopping him. Some of us just want to let in people who do not want to bother with Morse but can contribute to the advancement of the hobby in other ways.

Moreover, you sure chose an arbitrary SNR, didn't you? Want to change that to -10 db SNR over a 100 Hz bandwidth and see who gets there first? How about -20 db? Unless you know something we don't - if so, I must have wasted quite a few years of my past life solving equations and designing DSP equipment for the SETI program. We should have just built CW receivers instead, eh? We would have been off observing much sooner with CW equipment!

Yeah, I know -- 20 WPM rotted my brains.

>Some people. More people. Enough people?

I just looked up the figures the Dutch PTT gives about this (dated June 1990).
First: I described our licenses before, but a quick overview can't hurt:
We have 4 types, A, B, C and D. The total number of licensees is 14484.

The D license is the easiest one. It requires a simplified technical test,
no code requirements. D licensees are allowed to work on a part of the
2m band (only the cannelized FM part), using FM only, max 15 W.
There are 2916 D licensees.

The C license the the next one. It requires a stiffer technical test (it's
the same test as for B and A), and no code requirements. It gives all
priveleges above 30 MHz with 30 W max.
There are 6091 C licensees. (that is the highest figure)

The B license requires the same technical test as C, plus 5WPM code.
It gives the same privileges as C, plus full access to 10m, and CW only
access to a subband in the 15 and 80 meter band. Output 30 W above 30 MHz,
100 W in the DC bands.
There are 64 B licensees, so it's not popular apperently.

The A license is the 'highest'. It requires the same technical test as
C, plus 12WPM code. It gives full priveleges on all amateur bands, with
max 100W.
There are 5413 A licensees.

So, we have more code-less licenses as code-full ones. I guess a codeless
license will have success, looking at these figures.

BTW: upgrading from C is easy, just pass a code test to get a higher license.
All licenses are allowed to use some kind of CW, even if the're not tested
on that. D licensees using FM only, of course (FSK, AFSK). I know of people
using this possibility to practice before they take the code test.

Repeaters. Rules are easy: nobody is allowed to run an unattended transmitter.
Repeaters thus require a special license. These licenses are based on
coverage: the whole country is covered, but mostly only by 1 repeater.
We thus can work things out on 8 repeater channels, without subaudio tones.
Of course, closed repeaters are impossible.

Getting younsters in. A local well-known ham has proved several times how
this can be done: he showed what can be done with ham-radio on a school,
got a group together (members are 14-16 years old), gave weekly lessons
on the technical stuff, prepared the people for the exams, and helped

them on their first QSO's, giving them some operating practice.
Result: exam success rate of >90% (C license), and a whole group of
young, enthousiastic people helping each other, building antennas etc
in a group, and _very active_ on the whole spectrum of amateur possibilities.
These people are certainly not the worst kind of people occupying our bands;
I have more problems with some other people, with all kinds of licenses.

So, maybe this inspires you how it can be done. From a European look, the
American code/no-code discussion looks kind of silly.
I hope these figures prove why.

73 Geert Jan, PE1HZG

(the PE1 prefix is class C, if it matters)

First, thanks to everyone. There are some good ideas out there.

To clarify, I live in one of THOSE regressive neighborhoods that
consider log-periodic antennas to be an eyesore, rather geometric art.
I barely get by with the Butternut HF6VX, so putting an antenna on the
roof is not possible. Otherwise, I would put the TV antenna below the
ground plane to get rid of all the nasty RF. :-)

I'll try the 300 ohm hp filter to break the coax. I suspect common-mode
on the coax, too. After I made the posting, I was fiddling with the
coax and noticed my balun had a 75/300 switch on it. After putting it
on "75", things improved. How embarrassing.

I don't think it's the 120 VAC, because I can watch a tape on the VCR
without (much) interference. The VCR is a cheap plastic unit (purchased
before I became a ham), but I've gotten good results by stacking it
between a metal-encased tape deck and a metal-encased CD player. I'll
add some more toroids and see if that improves anything.

I'd rather not add a preamp to the soup, because it can go nonlinear. Passive components have their advantages.. The picture is otherwise fine when I'm not transmitting.

> I suspect that the data, not my lack of rigor, displeases you.
> I don't think I ever claimed that high-tech people are ATTRACTED to ham
> radio by the 13- 20-wpm CW requirement, but I do think that I demonstrated
> that amateur radio technical leaders usually are proficient in CW.
> Are you unwilling to concede this?

What your data shows is that those technically oriented people who have already chosen to go ahead and take CW exam(s) to get an amateur radio license, have a tendency to graduate to the upper levels in a greater proportion than those who are NOT technically oriented.

But your data limits itself to those who are already amateurs. It is limited to what now passes through the narrow filter. It fails to address at all that which is blocked by the filter, namely those who refuse to become amateur radio operators because of the existance of the CW exam.

How many technically oriented people would become amateur radio operators if there is a codeless license class they can use? Statistics that answer that question would be useful. Yours do not, and I'm not sure we can even get such statistics very easily. Since the matter before the FCC deals with instituting a codeless license, statistics that are presented in that matter should relate to the impact of the decision the FCC commissioners are going to be making.

I don't know what else you are trying to say with your statistics.

> I had expected that Technicians would show up in much greater numbers.
> If I had found that any substantial number of the technical leaders were
> Techs or Novices, I would agree that CW is so offensive to techies that they
> just learn the barest minimum CW and it is a serious hurdle. Do you suppose
> that the distribution is bimodal - most high-tech hams find CW no big deal,
> but most high-tech non-hams are kept out of ham radio by the code?

First of all, the "difficulty" of learning the code may not be the basis that is causing technically oriented people from becoming hams. If it were, then I would agree that the random variation of capabilities would more evenly distribute the technically oriented hams over the CW speed ranges. I believe CW is not difficult, especially for technically oriented people. Your statistics and my experience confirm this.

What the problem is with the technically oriented people (and for many others as well) is the PRINCIPLE of having a test for a skill they just have no interest in using, and don't need for what they believe they are interested in doing.

Some technically oriented people will go ahead and learn the code. Some will readily do so because they actually want to use code, or just learn a neat skill. Others will just go ahead and do so because they evaluate the cost of learning a worthless-to-them skill in exchange for the benefit of the privileges and prestige of an amateur radio operator. Still others, however, will look upon the code exam in a negative way. Let me give an example be means of a conversation I had with someone once:

me: To get a ham radio license all you need to do is learn some things to pass some simple tests. You learn how radios work, how radio waves propogate, the FCC rules, and Morse code.

him: They still require Morse code?

me: Sure, but it's not hard to learn; I did it in just a few hours spread over about 4 weeks.

him: Oh, so what did that Morse code that just came over your radio say?

me: I don't know, I forgot my Morse code. I can't do it anymore, and in fact I never could do it that fast.

him: Why did you do forget it? Can't you just get faster with practice?

me: Well, because I am just not interested in Morse code. I am interested in some of the many other things in ham radio.

him: Then why did you bother learning it in the first place? It sure seems silly to learn something you know you are going to just forget.

me: I know, and I agree, but I had to pass it to get my license?

him: Why do they still require that test?

me: Well, there are a lot of reasons, but basically it comes down to the fact that the present hams don't want it removed.

him: Including you?

me: No, not me, in fact I am one of many who are trying to get it removed for at least one license class.

him: Why do the hams who want to keep it think it should be required.

me: You'd really have to ask them. I've seen many reasons.

him: Well, ham radio sure sounds like interesting stuff, but if they want to keep having that Morse code test, I'm not going to bother.

me: Why? It's really not hard at all.

him: Hmmm, maybe not, but it sure seems stupid to require something that you aren't going to use and isn't needed.

me: I agree with you, but are you going to let a little thing like that keep you out of ham radio?

him: Probably. If they still have the test then that means most hams still want it; this is a democracy. I figure until they change it just won't be that fun being a ham.

me: You could become a ham now and swing the balance to help get a codeless license class going?

him: Naw, I'll just wait until better attitudes prevail.

me: But we need you now. We need your electronics background and that kind of stuff.

him: Well, if you do, then change the requirements and get rid of that stupid code test.

me: Do you think it would be too hard to learn? I'll help you.

him: That's not it, it's just the principle of the thing.

> 1) lots of young people, 2) lots of high-tech people.

It is hard for me to address this issue because I don't know what form their no-code license class takes.

Does class B allow for ALL privileges that a class A license allows for above 30 Mhz with no exceptions whatsoever?

How many of those 18 authors STARTED with a class B license?

How many of those 18 authors would not have become licensed at all had there been no class B license?

What these statistics COULD show is one or more of:
1. That a no-code license won't attract people.
2. That people end up migrating on up from a no-code license anyway.
3. That the privileges of a no-code license cause inactivity.
4. That the privileges of a no-code license are inadequate.

But which are correct? It will take further statistics and study to determine this.

Class A licence is obtained after passing Regs/theory exam and 12wpm code.
Class B licence is as above less code exam.

> Does class B allow for ALL privileges that a class A license allows for
> above 30 Mhz with no exceptions whatsoever?

Yes. The Class B licence is identical to a Class A licence with the addition of the words "those licenced under an Amateur Radio Licence (B) may not transmit on those bands between 1.810 and 29.700 Mhz".

Indeed Class B licencees are permitted to transmit morse but identify by voice.

I started with a no-code licence (GM8IKT) then "upgraded" to class A after a year. My interests were still with 50Mhz and above though. I found CW useful for Aurora-DXing and low signal 144Mhz work.

Today I heard a rumor that extended receive vhf/uhf amateur radio
equipment had been confiscated from the vehicles of radio amateurs
in the state of New Jersey. Does anyone know of this sort of activity?

I often wonder what a highway patrol officer would think of my
Kenwood TM-701 dual bander, but I really do not know what would happen

should one of those gentlemen take interest in it.

Note: The TM-701 as modified receives about 135-170 and 435-513 Mhz.

Thanks,

Todd

John, I agree 100% with your EMP posting. I would like to comment about number five on the CW hit parade however. The reason CW appears to be better between speakers of different languages is that the number of words sent is restricted to a small subset of internationally agreed upon signal abbreviations. Once you get beyond "UR 599 HR OM PSE QSL" the language barrier reasserts itself. This is rarely noticed on CW since so few words are exchanged, but quickly becomes apparant on a mode with a higher thruput such as RTTY or voice. Note that RTTY solves the "accent" problem but not the content problem.

Gary

>3) TV sets can easily handle signals on adjacent channels, if their strengths
>are about the same. This how Cable TV channels are set up. 16,17,18,19,etc.

Cable uses a carrier phase lock technique to make this possible. The cross modulation that does exist is not nearly so visible if all the carriers are locked together. This also means, by the way, that the channels are not on their FCC assigned centers, but the AFC in the set can handle it. Generally in the broadcast case signals are coming from various distances and at various strengths so this technique is not helpful.

```
>
>5) There are so many empty UHF channels since the FCC is protecting poor sets
>from all sorts of their own flaws: (from a few-year-old chart)
>IF beat                 20 mi. spacing  8th channel higher & lower
>Intermod                20              2nd thru 5th channel higher & lower
>Adjacent chan.          55              1st channel each side *
>Oscillator radiation    60              7th channel higher & lower
>Sound Image             60              14th channel higher & lower
>Picture image           75              15th channel higher & lower
>* The FCC doesn't make an exception for co-located stations.
```

Signal strength at a given receiver can vary from a millivolt to a few microvolts from one station to another in a market. The FCC spacing rules attempt to give enough protection to the grade A service contours to yield a S/N ratio of at least 42db. Most broadcast equipment is designed to have at least a 60db S/N ratio. Home viewers rarely see this good a picture. Receivers are getting better all the time and the FCC is reviewing the spacing rules in their "dropin" proceeding.

Consider that our coordinating body won't allow adjacent channel (20khz) 2 meter repeaters spaced less than 50 miles apart. Even this spacing causes annoyance to operators using either repeater who happen to live midway between them. Many consumers are unwilling to pay as much for the additional selectivity in their TVs that is offered by our expensive radios. And when they see additional interference, they'll blame it on those darn hams anyway.

Most technical decisions that were made about broadcast TV were driven by the political goal of delivering as many minimally acceptable pictures to the public as possible at the absolute least cost to the consumer. Adding $30 cost to a $69 portable TV so the hams will be happy is not a realistic goal.

****
If this made it through the first time, I apologize, I think my first posting didn't make in.
****

Here is a question I've been pondering for a long time:

What ever happened to R L Drake company??

I have a TR4, which is, of course, older than the hills, but is still working fine for everything I do. As a high school kid, I regularly visited the local ham store and dreamed of owning a TR7, which I still would like to own.

Was Drake bought out? Did they 'go under'? or just what happened.

E-Mail or postings invited.

TNX,

Greg, KA7CJA

Regarding the Class B (no-code) licence in Britain, Phil Howard asks:

> Does class B allow for ALL privileges that a class A license allows for
> above 30 Mhz with no exceptions whatsoever?

One exception: (quoted from RSGB 1990 Call Book)
"When using morse code, you [Class B operators] are still required to
identify your transmissions in telephony in the usual way
because your morse cannot be guaranteed to be readable."
There were additional restrictions until perhaps 10 years ago (no use of cw).
I know of no other restrictions on Class B licencees; do any of the G readers
of this net?

> How many of those 18 authors STARTED with a class B license?

This is, of course, impossible for me to determine in the general case.
HOWEVER, the calls of the authors of half the "Class A" articles show they were
licensed before the first British no-code license was issued in 1964. Now you
see why the worry about an aging ham population. At the present, no-code calls
are being issued at about twice the rate of Class As (and the Class As
include all upgrades, since a new call is issued).

> How many of those 18 authors would not have become licensed at all had
> there been no class B license?

See above.

**** rest of Phil's message deleted ****

Hope you disinterested people haven't reached this far in this posting.

I can. I keep (and maintain spare parts for) a PAIR of TCS-13 transmitter/receiver units (purchased for $10.51 EACH in their sealed water-proof bags from DoD Surplus in about 1970!) Working with a dynamotor "whining" in the background is interesting, but the TCS cables are pretty long...

Internal mods to both replaced the link coupling with a pi network. Both also have SO-239 connectors. I removed the AM stuff from one transmitter and reworked the circuitry to give about 150 watts CW (the old carbon mikes aren't much good, anyway). 1.5-12 MHz continuous covers 160-, 80-, 40-, and 30-meters.

Real radios glow in the dark.

I just heard DOVE on my HT for the first time. It was all packet. As I was made to understand, DOVE also carries a voice transponder. If this is so, is the voice transponder active? What times if any does it transmit? I am not set up to receive packet so it would be of more interest to me to hear the voice transponder. If anyone can provide me with more information, I sure would appreciate it!

Good to see you got the hang of the idea of encoded serail numbers to confirm exotic dx qso's. I agree it would still enjoyable to collect wallpaper (QSL cards that look pretty or exotic) but with current

technology there is no reason to have to wait upwards of two years for
qsl cards to confirm a badly needed country.
It seems to me part of the fun would be to figure out an algorithm which would do
the job -- and quickly. In addition "electronic QSL
cards" do not require SASES or IRC. For that matter those exotic
DX-expeditions which will not use the buro might welcome something of this
nature. As for the delayed throughput during an expedition - one
could consider it to be similar to a SS/Sprint/WAE, etc contest. It
takes more skill to copy information in addition to a quick rst (Hi!).
Keep those cards and letters (e-mail's) coming.

I sincerely apologize to all those whose feelings have been hurt by my
recent postings. To my defense, I only have to say that I was not aware
of any "taboo" subjects that may have existed on this net (BITNET) by
open or tacit agreement among its members.
(Brian, can you send me a list of all the do's and dont's... thanks)

I will continue to subscribe and post to this newsgroup as I see fit,
until told otherwise by the ruling authority, or until the noise level will
exceed my disk capacity... I will use more tact, of course, but I will not
cease to look for FACTS.

To those who have written to me privately: thank you. Your comments have
been most helpful in trying to understand your hobby and its position in the
everyday life of many non-hams like me.
I will reply to you individually as time permits.

To Jordan (n5qvi, The Ohm Boy) and Chris J. Davis (chris@locus.com):

Thanks for nothing. I hope you feel better now, having let your frustrations out. Glad to have served as your lightning rod... no need to thank me.

Rest assured that my admiration for those in your hobby who work for its advancement is unshaken. I can still discern between comments made in a dubious state of soberness and the mature, balanced comments made by others.

No, if and when ham radio will "lose" any bands, it will not be because of the presumed yuppies like me (whatever that means), but thanks to the inability of those like you to come to grasp with reality.
You will then have to face your fellow hams... good luck.

Just for the record, and not because it matters that much: no, I did not attend an Ivy League school, and no, I'm not a yuppy (again, whatever that means). I'm ready to bet that you spend more on your radio equipment than I do on my cellular phone...

In article <KPT.90Aug10101913@dirty.doc.ic.ac.uk> kpt@doc.ic.ac.uk (Kevin Twidle) writes:
>Yes the R1 does have 10 scanning banks with two frequencies, tuning
>step and receive mode settings for each bank

But the R1 doesn't have "banks" for the memories. There should be at least 10 (and maybe more) banks that cover (possibly user settable) contiguous (possibly overlapping) memory channels, so that the memories can be programmed according to services. In this way, one can select whether he wants to listen to 2m, 70cm, the police, fire, etc., without going through all the memories and enabling/disabling each memory; instead the banks are enabled or disabled for scanning.

Icom did a lousy job of designing the user interface for this radio. With the microprocessor power that is available now-a-days, for less than $0.10 (an 8080 with a couple of k would be more than powerful enough), Icom has no excuse for their poor performance. Either they haven't done their marketing research and they don't know what the consumers want (a highly likely possibility), or they can't find competent computer engineers to do this work for them. On the other hand, maybe they know what the customers want, but they are purposely not delivering, in order to have something to do for next month's model. This last possibility, in my mind, is unforgivably despicable.

During the late 1970s, the Japanese radio companies began marketing HF rigs
much more actively in the US.  With the combined markets of the US and Japan,
they took advantage of the economics of scale, and produced good radios at
a bargain price.  Collins and Drake were producing rigs of better quality,
but they couldn't match the price, as they did not want to market in Japan.
Once the sales of their rigs dipped below a certain level, they bowed out
of the market, proclaiming the market to be too small.  Drake continues to
produce consumer electronics, and Collins (swallowed up by Rockwell) still
produces radios for government and aircraft markets.

Are there any support groups for the families of people who have been
trapped in the conflict in Kuwait? In particular are there any sources
of hard information on what is happening to the people who have been
moved out of Kuwait into Iraq?

Is Kuwait still active on Amateur Radio, or have all the stations been
closed? Is anything coming out of Iraq?

Please send mail, and I will summarize.

I refuse to accept the title of "sclerotic and gasping old fart" just
because I oppose the concept of a no-code license.

When the FCC rams no-code down the throats of the ham community, as it
appears to have every intention of doing, I will be working to preserve
what can be saved. What have YOU done for ham radio lately?

This one should be easy. GTE has adopted a nationwide policy that all amateur autopatches are to be charged at the residential rate. About all I can suggest is that if you don't like the answer you get, keep going up the hierarchy until you get an answer you do like. Get everyone's name along the way. If a manager tries to stonewall you, a letter to the president of GTE - threatened or actual - works wonders.

Well, Julian is one of the premier gadflies of this net, and as such has
helped raise the level of debate, but that's probably not what you
wanted to hear.

Hmm. He's chairman of the So Cal Digital Comm Council, which is the
packet radio organization covering the Mexican half of California
(you know, the part south of the pot fields). As such, he promotes the
growth of one of ham radio's few innovative activities. They're also
frequency coordinators of a kind.

I think that's a pretty useful thing.

Next question?

Someone wanted to hear some arguments AGAINST no-code. We'll, I've heard a few attempts, and I shall summarize:

--- International agreements require a Morse Code exam.
--- Morse Code is a tradition in Amateur Radio.
--- Morse Code will keep the "riff-raff" out of our bands.
--- CB and GMRS is available for people who won't learn Morse Code.
--- A No-Code license just lowers the requirements for a license.
--- Morse Code ensures that only the dedicated will get licensed.
--- Morse Code is easy to learn.
--- 5 WPM is not a barrier for anyone seriously interested in ham radio.
--- Studying Morse Code exposes new hams to a mode they might like.
--- Studying Morse Code forces discipline on new hams.
--- Morse code is necessary for emergency communications.
--- We need a trained pool of skilled CW operators.
--- Morse Code is necessary for the National Traffic System.
--- Morse Code can get through when other modes cannot.
--- CW is the most efficient mode.
--- A CW transmitter is simple enough to build in an emergency.

And now for the rebuttal:

--- International agreements require a Morse Code exam.

This arguments fails on two counts. First of all, the actual wording of the agreement is vague. It says "knowledge of Morse Code" is what is required. The second, and most important, is that the agreement applies only to licenses granting privileges to operate below 30 Mhz. Since the codeless license proposals only grant privileges well above 30 Mhz, this argument does not even apply to the proposed new license class.

--- Morse Code is a tradition in Amateur Radio.

This is correct. But every phase of advancement in Amateur Radio has its own traditions. The belief of many is still that good traditions are to be honored and respected, not shoved onto people. Morse Code has a place in Amateur Radio, and always will. The traditional license classes will still continue to require a Morse Code exam under most proposals.

--- Morse Code will keep the "riff-raff" out of our bands.

This is not likely to be so. There is already a lot of "riff-raff" in the Amateur bands. Hams have their bad apples, too. While some people who would be "riff-raff" might be turned back by a code exam, if they were interested in leaving the CB channels, they probably would be operating illegally anyway. We just lose a chance to turn them around.

--- CB and GMRS is available for people who won't learn Morse Code.

This is not true. The CB and GMRS services are not appropriate for technical experimentation; the Amateur service is clearly the place for such things. FCC rules part 97.1 spell this out very clearly.

--- A No-Code license just lowers the requirements for a license.

Since some proposals for a new license class increase the level of the written exam beyond that of the Technician, and grants fewer privileges than the Technician has, the argument is clearly false.

--- Morse Code ensures that only the dedicated will get licensed.

If someone is interested in Morse Code, the exam is no barrier to them. If they are not interested in Morse Code at all, then it is a barrier to them just as much as having to learn any other unrelated subject. Since many people intend to not ever use Morse Code, then it is just as unrelated to them as learning how to drive a team of horses or pilot an oil tanker around ocean reefs.

--- Morse Code is easy to learn.

Clearly this argument, which is truthful for a large number of people, is a contradiction to the argument that the Morse code exam helps keeps out "riff-raff". Many things are easy to learn, but no one is expected to learn everything. Just because something is easy to learn does not say why it must be learned.

--- 5 WPM is not a barrier for anyone seriously interested in ham radio.

Neither is a written exam on the technical characteristics of packet radio, but we would not expect to force everyone to learn these things even though most hams could if they just put their mind to it.

--- Studying Morse Code exposes new hams to a mode they might like.

Studying anything can expose anyone to something new and exciting. Why must Morse Code be singled out to force everyone to be exposed to it, and other modes don't get similar exposure? People can be exposed to everything by just participating in Ham Radio itself. If you turn someone away immediately, then will never have a chance to become interested in anything particular in ham radio. The testing process is not supposed to be an advertising and brainwashing process for new recruits.

--- Studying Morse Code forces discipline on new hams.

Far more discipline, and useful discipline, is learned by actual radio operation. Would accept someone who passes all the test elements for the Extra class as a ham if they decided that they didn't need to even operate and are fully skilled already as a ham? Of course not.

--- Morse code is necessary for emergency communications.

More communications is now taking place in other modes, and many hams, including an increasing number of Technicians, don't use or are even capable of Morse Code operation. Emergency communications still take place, but use primarily voice and packet modes.

--- We need a trained pool of skilled CW operators.

For what purpose? There will always be a number of people interested in operating (and thus learning) Morse Code. Why is it necessary to train everyone, when most of the people who would be licensed under the new proposed license class would just forget the code if they had to learn it otherwise.

--- Morse Code is necessary for the National Traffic System.

More and more traffic is now passed by packet radio, and much is still passed by voice. This is not to say that Morse Code is not contributing, but rather that its not the only thing around.

--- Morse Code can get through when other modes cannot.

Sometimes this is correct, but even if it were always, it does not explain why everyone has to use the mode. More can be said with voice. You can see things better with ATV. These arguments are truths, but do not apply to requiring hams to be involved with, or learn how to use, any particular mode. I could just say "one plus one equals two so therefore..." and assert anything I wanted using that kind of reasoning.

--- CW is the most efficient mode.

This is false. The very reason that CW can get through when other modes cannot is due to its high level of redundancy. It is a narrow mode, but it is also a very slow mode. Efficiency in terms of the information conveyed for a given bandwidth in a given amount of time over a given distance is not Morse Code's great strength. It does have others.

--- A CW transmitter is simple enough to build in an emergency.

How many of you even know how? Is this even likely to happen? An emergency of the extreme that requires you to build your transmitter would require little more than just sending SOS, as you are going to be isolated somewhere anyway.

When I was in Dayton this year I noticed an HF xcvr which was strikingly
similar to the ICOM IC-781 at the Hamvention. Does anyone know which came
first ? Have we begun to copy the Japanese.
If anyone has the address of Signal One Corp. - I'd appreciate it. I'd
like to get their catalog on the transciever and put it into my fantasy
folder.

> The coordinator's authority ideally comes from the consent of the
> governed (sound familiar?). If the operators (not necessarily OWNERS)
> of coordinated repeater systems consent to the recommendations of
> the coordinator, there is no problem.

And the guy who is simply applying to get a coordination is one of the "governed". So who should be allowed to be members of the coordination group with voting privileges?

Also, just how the coordinators decide to arrange the repeater frequencies affects all of us who use the band.

> As soon as the bulk of the operators stop cooperating with the
> coordinator, they stop cooperating with one another by definition.
> They have only themselves to blame for their own mess. Too bad.

It's not their own mess.

What about the NON-operators who are so because they cannot get a coordination? When they say "no frequencies are available" is it really true?

What is a reasonable way to prevent the necessity of creating yet another coordination group? Doing this is fundamentally a bad idea, but if the existing group won't respond, what else is there to do? (only CONSTRUCTIVE ideas wanted)

It sounds like, then, that class B licenses are being issued, but that both class A and class B numbers are way down. Neither class is bringing in the technical people. That's unfortunate.

What this shows is that there may be other reasons for the lack of young hams becoming licensed. I really cannot say what this is. It sounds like a reasonable no-code license is available.

Is the 2 meter band totally overrun by the no-coders?

Oh, but your ground mounted vetical probably induces RF into the house
wiring, so the dummy load test isn't a good one.

Try a big choke on the 117 VAC power lead for the TV and VCR. Just get
a large toroid, and wrap the line cord around it. This may make the
line cord short enough that you need to plug it into an extension cord.

The August 13 issue of QRZ DX says:

"V31BB is a Silent Key, but his callsign is not silent. A non-ham from Georgia, who recently purchased some amateur radio equipment and who doesn't know any better, has been using Jim's callsign. Thanks W5HAC."

karn@thumper.bellcore.com writes:
>>]You have to realize that the "we can't change anything, we'd get sued"
>>]line is basically nothing more than a cop-out.
>> I'm sorry, Phil, but I have to disagree. Even a frivolous lawsuit can
>> cause one considerable trouble and expense.
>> Ask the coordinators in Texas what it feels like to be sued.
>Sue for what damages??

(Background: I was president of the Texas VHF-FM Society during the time we were being sued.)

We were sued officially because of a choice of wording in an article in our newsletter: we said that someone had received a citation from the FCC when the letter they had received, which was for all intents and purposes a citation, did not include that word.

The article discussed a situation where one amateur had allowed a repeater group to operate a repeater under his callsign, and then had revoked that authorization so he could put up his own repeater; this resulted in a repeater war between the group and the individual. The FCC was called in, and asked us who was coordinated. We replied that the individual was, and the group was ordered to shut their repeater down, which they did. End of story - we thought.

We published an article about the situation, and got sued for libel.

During what settlement discussions we had, though, the plaintiff consistently demanded that we reverse our decision and coordinate his repeater - a demand we found unacceptable.

>> While anyone CAN sue, the most likely people to sue in these cases
>> are the crackpots that are also the most likely to fight over
>> coordination matters.
>Sue for what damages???
>Seeking what relief?

Damages? They can sue for every asset the organization, and its individual coordinator(s), have, on the premise that we damaged his reputation. The plaintiff in our lawsuit left damages to be soecified at the trial, but claimed that we had irreparably harmed his business.

Relief? He can demand that the coordinator do things his way.

John's right. Being sued is no picnic. It brought almost all of our activities to a screeching halt, because we had to do nothing that would jeopardize our position in the suit, or our financial status should we lose. We had to be very circumspect in publishing our newsletter and discussing the progress of the suit with our members, lest the plaintiff hear something he could use against us. We lucked out, in that we were represented by a good lawyer, Lanny Priddy, K5LP, who agreed to defend us for only his actual costs. The defense could easily have cost us thousands of dollars, which we would have been hard-pressed to recover, since the plaintiff had little in the way of assets - he had to change lawyers once during the progress of the suit because his first lawyer hadn't been paid.

Yes, the threat of being sued is a credible deterrent, whether Phil thinks it's a copout or not.

Gasp! You mean one of the most rabid no-coders here admitted that the code requirement may not be the only reason that young people aren't getting into ham radio? Be still my beating heart!

Maybe, just maybe, the problem lies somewhere else...like we're not making ham radio atractive enough to the younger members of society. Naw...that's too simple for the no-coders. Must be something else. Let's let the lazy types in anyway, and then we'll look for other problems.

Now now. I am genuinely curious if these things have any kind of overcharging protection such that one could just replace something and get on with it.

The guy gave it to me because the bearcat (uniden?) repair place
he sent it to told him that he should just buy another unit instead
of spending money on fixing it. He said it would not hold a charge.

Well even myself who pulls off stunts like this with improper chargers
know that he can replace nicad packs and see what happens.
Why I didn't do this in the first place is beyond me.

Can any offer any helpful suggestion

Julian, can you provide a reference to the ITU document(s) that state
that emergency communications is no longer a facet of amateur radio?
I must have missed them.

The most current orbital elements from the NASA Prediction Bulletins are
carried on the Celestial BBS, (513) 427-0674, and are updated several times
weekly. Documentation and tracking software are also available on this
system. As a service to the satellite user community, the most current of
these elements are uploaded weekly to sci.space. This week's elements are
provided below. The Celestial BBS may be accessed 24 hours/day at 300,
1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Let's see, an entry level transmitter in 1962 cost $69.95. This was an Eico or Knight kit transmitter in the 50 to 75 watt input power class with CW and AM voice, crystal controlled of course. A decent new receiver cost about $150. A top of the line Chevy sedan cost $2000.

Today a HR2510 frequency synthesized SSB and CW radio costs $249 and a fairly full featured all band HF rig such as the IC725 costs $700. A Chevy sedan costs $28,000.

Looks like today's radios are already cheaper in real dollars than they
used to be. I'd love to see a good $69.95 radio available today, but
the chance of it happening is about as likely as 18 cent a gallon
premimum leaded gasoline.

If any of you ham-radio operators hear of any news from inside Kuwait,
I would appreciate you contacting me. I'm mainly concerned about how
the civilian population is being treated.

thank you,
anwar

I wouldn't advertise it, if you know what I mean, and I think you do :)

I remember the time I pulled off to the side of I-195 near Freehold
to check my trunk lid a couple years ago. As I slid back into the
car, I noticed all these red lights flashing behind me on the
shoulder.

"Good grief!" I thought; I gave a 'what-for?' shrug
to the officer, who asked if I needed any help. I informed
him that I was just checking, and as he turned around to
walk back to his patrol vehicle, he noticed my MICOR control
heads and asked what they were for.

I replied that they were for the fire department in my home town.
He perked up "OH! You're with the fire department, OK! Bye!"

No problem!

In article <205@bongo.UUCP> julian@bongo.UUCP (Julian Macassey) writes:
]Imternationally, the only reason for amateur radio is self training
]and experimentation. In most of the world "H&W Traffic" etc is third
]party and illegal as in "go to gaol". Modern telecommunications has
]long since outstripped anything we can currently do with 2 stations
]passing 3rd party on 20 meters. Think how much more traffic can zing
]directly to the recipients if you have 21 direct dial phone circuits
]rather than two tired radio ops passing messages to a guy in Atlanta
]who will try (possibly via telco) to get the messages to
]Pennsylvania.

Sigh. Here we go again. All I can say is that my experience disagrees with your theory. There have been too many situations that I have been involved in, both intra and inter-nationally, where the authorities have asked for and gotten amateur help in emergency communications. If we aren't needed for that, why do they keep asking?

Sure, they could do away with us with ENOUGH technology, but they don't have the budgets for that. On the other hand, since a pool of ham operators is always present, it provides the buffer during those rare occasions when there is a major emergency.

Furthermore, amateur radio has traditionally won many battles BECAUSE of our emergency work. When we go up against others in a governmental forum, our emergency justification seems to almost always have a significant impact in the deliberations. I watched an Air Force officer (non ham) show up, unsolicited, at a zoning hearing to tell the local city council how the US government considers ham radio a vital part of its civil defense/disaster radio network.

You may be right about the international justification (although I know of a lot of nations that have been very thankful for ham emergency communications). You are simply dead wrong about the politics of ham radio vs. the rest of the world when it comes to emergency communications. I believe you probably mistake the potential technical capabilities of available non-ham systems for an existing OPERATIONAL capability. There is a HUGE difference.
]

]>
]>3) TV sets can easily handle signals on adjacent channels, if their strengths
]>are about the same. This how Cable TV channels are set up. 16,17,18,19,etc.
]
]Cable uses a carrier phase lock technique to make this possible. The cross
]modulation that does exist is not nearly so visible if all the carriers
]are locked together. This also means, by the way, that the channels are
]not on their FCC assigned centers, but the AFC in the set can handle it.
]Generally in the broadcast case signals are coming from various distances
]and at various strengths so this technique is not helpful.
]
Well, actually the cable channels operate on the correct carrier frequencies
for the channel. It is broadcast TV that runs offsets so that a few
users in a fringe area between two channels ON THE SAME CHANNEL don't
get low frequency beats between the carriers.

However, the reason that cable requires phase lock is to minimize the
effect of cross-modulation in the cable TV amplifier chains. This
modulation builds up through multiple re-amplification of the same
signal. Broadcast receivers don't have this problem unless there
is a drastic difference in signal strengths and they don't have
good front end amplifiers and/or mixers. Also, the sound carriers,
which are also high power, are not harmonically related to the picture
carriers.
]
]Signal strength at a given receiver can vary from a millivolt to a

]few microvolts from one station to another in a market. The FCC spacing
]rules attempt to give enough protection to the grade A service contours
]to yield a S/N ratio of at least 42db. Most broadcast equipment is
]designed to have at least a 60db S/N ratio. Home viewers rarely see
]this good a picture. Receivers are getting better all the time and the
]FCC is reviewing the spacing rules in their "dropin" proceeding.

A TV receiver cannot get a decent signal with less than 1 MILLIvolt.
Cable TV delivers 0 to +10 dBmv (1 to 10 millivolts) to the receiver.
Signals of a few microvolts are not an issue.

]
]Consider that our coordinating body won't allow adjacent channel (20khz)
]2 meter repeaters spaced less than 50 miles apart. Even this spacing
]causes annoyance to operators using either repeater who happen to live
]midway between them. Many consumers are unwilling to pay as much for
]the additional selectivity in their TVs that is offered by our expensive
]radios. And when they see additional interference, they'll blame it on
]those darn hams anyway.
]
]Most technical decisions that were made about broadcast TV were driven
]by the political goal of delivering as many minimally acceptable pictures
]to the public as possible at the absolute least cost to the consumer.
]Adding $30 cost to a $69 portable TV so the hams will be happy is not
]a realistic goal.
]

We aren't talking about using the TV spectrum for ham radios. We are
talking about using it for public safety. The ENTIRE amateur spectrum
below 1 GHz is about the same as the spectrum usage of ONE UHF TV station.

R.L. Drake is still around. I believe they are still located in Miamisburg, Ohio.

They no longer manufacture amateur radio equipment BUT they still maintain a staff/parts for their equipment.

Their current product line deals with TV satellite receivers.

A friend of mine here has worked with them recently. If you need their number, e-mail me.

I want to charge and maintain a charge on a gel-cell from an
automotive electrical system. I think that one way to do this is to
hook up a low-voltage-drop voltage regulator IC in constant-current
mode for the maximum charging current (about 1.6 A in this case).
This will limit the current to the gel-cel to the maximum allowed
bulk-charge current if the gel-cel is deeply discharged, but allow the
gel-cel to be charged at a pretty high rate until it gets pretty full,
and then taper off. Do some of the battery experts have comments or
pointers to more information about this application?
Mostly this battery will be charged from an AC charger, but I would
like to be able to charge and maintain the charge in an automobile,
also.

That may be a good reason for the CW requirement now days. Without tubes which may become extinct in the next decade or so what good is that even. The origional reason for CW in HF requirements was to be able to communicate with distressed marine vehicles which ALL carried a minimum 500KHz emergency transmitter often capable of being powered by hand generators. Later the aeronautical interests adopted these radios for emengency purposes.

I wonder what the current requirements are along these lines. 500KHz is still an international distrress frequency isn't it?

And what do the "cellular as an emergency service" nay-sayers think of this use of Motorola's cellular system? I'm probably starting to sound like a broken record but we need to find new sources of political capital to keep our allocations! Public service, though a good customer in the past, isn't enough. The suggestion that education is a reasonable "market" seems like a good one, though it would seem that we should look to develop other sources too, eg use in research, public data service, etc.

Subj: Re: Qualification-based licensing

The way I (mis)understand EMP, there's nothing you can do to prevent damage from it. Yes you can protect yourself from lightning's direct effects, but the indirect effect (EMP), not without hardening. Anyway, I should have gone a bit further in my statements, to indicate:

I am FOR a no-code license, but code DOES still have its place in the real world, vis-a-vis EMP if for no other reason. Consider:

Balloons are still allowed in the HOBBY of flying.
Model Ts are still allowed on our streets.

Large-wheelers are still allowed to be ridden by bicyclists. (Looking at the first example, I realize I may be implying too much that balloonists are "merely" hobyists. Such is not my intent.)

Sailboats still ply our waterways, as do paddlewheelers.

Amateur Radio is a hobby, and as such it has MANY facets. To state that any one facet is UNNECESSARY is tantamount to bigotry, IMHO, and I can point to several teenagers in my "home" club who would agree. This is not a flame directed at ANYONE; I sometimes get a bit strong in my statement of feelings...one of my personality quirks (I think we all have one or two of those..).

Anyway, to end on a higher note (A above middle C): thanks for your comments, Rick. I do realize we are all technically-oriented, I had simply never seen EMP taken into consideration when all our modern techno-rigs were being discussed. There are still several factions out in the world, any of which MIGHT someday use a nuclear weapon against the "civilized" world, and a lot of hams (myself included, as I have no major desire to work CW) are not going to be able to assist with traffic handling, due to their rigs' inability to cope.

73, and good Hamming!
Mike N5LTL

Does anyone know how to increase the UHF Rx on a Yaesu Ft-470. I have found a way to increase the VHF Rx to 130-170 MHz and would like to do the same for UHF.

BTW: Being a new addition to Info-Hams (and a fairly new addition to the Communicator licence with great interest. Is it possible that in the midst of the discussion that sight of the end goal may be lost?

It appears to me that the vast majority of my fellow hams are gentlemen with much experience in life, shall we say. It also appears to me that the influx of new hams is minimal. Is it possible that new class of licence might be the only manner in which to save the spirit of our hobby from its demise?

Now, check your flame throwers at the door, gents. This is just food for thought.

So, why mess with communications equipment if you don't want
to communicate with anyone?

Transmit into a dummy load, there'll be nobody to bother you there.

Actually as a percentage of the operating frequency, this is even closer spacing than at VHF. The Q of a filter effects it's PERCENTAGE bandwidth. Normal practice is to space the channels as far apart as possible, filling in the holes only when new stations are built.

>
>]Designing a fliter system that is very flat with 0.2 degree phase linearity

>on each side, which would greatly reduce the waste of UHF spectrum.

In fact the FCC has recently completed a "dropin" channel study to see if more channels can be used in the VHF band. There are many factors to be considered such as co-channel interference, adjacent channel interference, second adjacent channel interference, intermod, and image interference. Already mileage seperation rules are routinely waived if the local terrain will insure adequate blockage. Another nasty little problem is TV channel 6 and noncommercial FM broadcasting. Since they share immediately adjacent frequencies, this has been the source of many problems. Also TV channel 14 has been taken out of service in some areas to protect land mobile users. Similarly Ch 69 has been eliminated in many communities to protect cellular phone.

>

They also use much less power which helps as well. But it's not another television service. Remember too that there are $50 billion dollars worth of receivers out there now and nobody seriously thinks they can obsolete that much equipment overnight.

>HDTV use microwave spectrum ONLY.

You may not have heard of multipath problems, but I sure have. Moving
the antenna as little as an inch up down or sideways can change the
picture from great to unusable. Most homeowners don't install antennas
with that much care. Most pay TV using the MDS system uses trained
installers for the receivers. Most of the receivers are installed at
hotels and bars. Many locations simply can't be served. Microwave
service is extremely terrain sensitive. What might work in the
wide open spaces of the west simply fails in the rolling terrain of
the east and in densely populated areas. Case in point, we use microwave
links between our studios and transmitter in Atlanta. Due to the
high rise mania in midtown, new buildings are springing up all the
time in or near our path. We have had to construct new towers twice
in the last three years to keep our signal going to our transmitter.
In one case the building was directly in the way, in the other case
the building was in the first fresnel zone and multipath became
intolerable. That's two new 300 foot towers less than 100 yards
apart in two years. No consumer is going to put up with that.

Since I was both licensed and a subscriber to 73 during that time period, I can say that Wayne was NOT in favor of incentive licensing then nor now. In fact he attempted to setup an opposing body to the ARRL called the IARL to lobby against the ARRL's incentive licensing scheme. He predicted then that incentive licensing would stifle amateur radio. I have every issue of 73 on file (charter subscriber) so if you have a quote that supports your claim, post the issue number.

So you're saying that the ITU in their great wisdom forsaw EMP from nuclear weapons in 1927 when they mandated CW? Get real! If EMP gets your general-public electronics (your radios) you're going to send and receive CW? With what? Are you going to dust off your tube radio, throw away it's microphone, and send CW? Or maybe you are going to BUILD a radio from the parts of discarded TVs. Too bad! all the TVs are solid state too and are trash.

In reality, protection from EMP is fairly well understood by the technical community. Other than equipment connected to large outside antennas, most equipment will survive any EMP that YOU will survive. In the ham radio world that means VHF/UHF HTs. Let's see, where do I plug the CW key into this FT470?

Hi!

I am thinking of buying a 2m mobile and I have a few questions about installing it in my car. I wanted to use one of those on-glass antennas, since I am really not keen on drilling holes in my new car! My car has a post-factory installed tinted windows that is actually tinted plastic coating. Will this tinted layer adversely affect the performance of the antenna? Or perhaps will the antenna affect the tint?

The rig I am thinking of buying is the Alinco DR-110. I already have an Alinco DJ-160 HT and that has been good value for the money. If anyone has any recommendations, I would be interested in hearing them.

On a slightly different note, how much traffic does this digest get? I am on the BITNET side of things and when the digest was carried by the SIMTEL machine, the digest came at about a rate of one a day, now that rate seems to be about one every full moon.

|> falling off a tower during climbing?

The most common fix is to use "gorilla hooks." These are hooks that have a snap-closed link over the hook opening (like a carabinier clip) that attatch to your climbing belt (One on each side) with a three or four foot section of line. On the way up, you clip one to the tower, climb a few rungs, reach up as high as you can and clip the next one. Reach back and unclip the first. Climb a few rungs... (etc.) If you slip, one of the hooks will be in place to hold you. The clips pretty much get hooked on where you would normally be holding with your hands anyway. It's low-cost and low-tech. The people who sell climbing belts in the back of QST usually sell gorilla hooks if you don't want to make your own. (At least your estate will have someone to sue.)

There are also commercial devices that attach to a cable running down the tower and lock to the cable if you start moving fast (assumes fast = falling.) These are often available from tree service suppliers or construction suppliers that specialize in steel.

Relevent to whom? Why should I learn how long it takes to send a FAX or how many lines are in one? It's not relevent to me. Why cant the test be only what I want and not what I don't want? These are the imponderables of ham radio. In the end, they make little or no difference -- the code, the questions, the process -- the test will never satisfy everyone, and it will satisfy the people who are about to take it least of all. I'm not saying you shouldn't care about making it better -- but I am saying that you never will.

You'll be dead and I'll be dead and most of everyone we ever loved,
hated, or cared about will be dead too. The universe won't notice and
won't care.

If you are fool enough to think that God, as your personal handmaiden,
is going to help you survive the attack, provide you with power,
re-erect your antennas, and make you a valuable addition to
reconstructing the tatters of society that remain after a nuclear
attack, then by all means, learn CW. Perhaps you'd also like to father

all the children we'll need to repopulate the world, too.

The idea is to make nuclear war unthinkable, Strangelove. Not to
try to survive it. The more people who think nuclear war is survivable,
the more likely we are to have one. Wake up.
          - Brian

>Now we have two grounds internal to our circuit board.
>What do we do with them?

Tie them together at the power supply, or as close to the power supply as
possible. That way, switching currents in the logic ground do not lead to
voltage variations in the analogue ground because of the resistance in
the logic ground wires.

Yup and us guys down here in the third world where the local telco still uses Strowger gear and the phones are all rotary, we don't worry about EMP either. Every day, most of our calls fail and the audio quality sucks. Long distance is a nightmare. But hey when they drop the big one, we can call each other up and say: "Cecil, did you see that flash? Sure scared the womenfolk round here, them that's still alive.

But of course, all the cars with microprocessors will be useless too. Good thing I know how to ride a horse. If I had my way, I would make horsemanship a requirement for a drivers licence. When nothing else will get through a horse will. We need horse riding skills for disaster relief.

And now we return you to the late 20th century.

An important point for folks to remember! Encryption in this sense is
no different than passwords, and there are tons of repeater control
passwords flying around the ether.
]is hidden. A public key scheme would be much better here, since it would
]eliminate ANY possibility of hiding information (anyone could verify
]an authenticator, even though only the originator could have generated
]it).
For the truly paranoid, this is not quite true. For example, the
choice of public key could be used to transmit some bits of information
to a secret agent ;-)
]
]Of course, to make any such scheme cryptographically secure it would
]have to consist of at least 64 bits of both plaintext and ciphertext.

Not quite true, either. For one thing, the plaintext can be extended
with random salt, which does not need to be sent. Thus only the
ciphertext need to be long. And, it only need be long enough to
detect guessing. The public keys can still be quite long.

In article <09.Aug.90.10:00:41.BST.#1077@UK.AC.NWL.IA> PJML@ibma.nerc-wallingford.ac.uk ("Pete Lucas, NCS-TLC, Holbrook House, Swindon") writes:
]EMP as a justification for CW testing? Dont make me giggle!
]Remember; a decent EMP will take out *all* your semiconductor devices; it will
]also make quite a mess of even some electromechanical systems (do any telcos
]still have STROWGER exchanges? *they* just *might* survive!).

I think it may be time to inject a bit of reality into this EMP discussion. I have heard the following myths:

(1) EMP isn't a threat, because the same bomb will destroy you anyway.

-This is simply NOT true. A deliberate EMP attack involves detonating high yield weapons at very high altitudes. Only the light and the EMP makes it to the earth's surface.

(2) EMP will wipe out all your semiconductors.

-Hey, folks, EMP is not some magic demon that seeks out and destorys micron-sized transistors! It is radio frequency electromagnetic radiation, of extremely high power, lasting a very short time. As such, it requires antennae before it can do damage. If your equipment is reasonably lightning protected, it is also reasonably EMP protected. Furthermore, the energy goes down with frequency, so most 2 meter and 440 equipment will survive (unless it gets zapped from the commercial power mains). Most of our repeater sites here in Arizona are hardened to FEMA standards for EMP, and have emergency power that would also withstand EMP. We did this primarily for lightning protection! Your HT's would almost certainly survive (unless they were plugged into rechargers at the moment of truth). Lots of HF gear, but certainly not all, would survive. Mine would probably survive because it spends most of its time disconnected (to protect it from lightning).

Re: EMP as a reason for CW. Well... that's stretching it a bit folks.
CW IS useful in emergencies, but for more mundane reasons:
(1) It gets through where SSB doesn't.
(2) Lower radiated power can be used. Since power supplies AND antennae are problematical in emergencies, this counts.
(3) It is, in fact, much easier to rig an emergency transmitter. As has been pointed out, it is not easier to rig an emergency receiver.
(4) It is more likely to be available, especially in third world countries, than DSP based systems (at least for the next 10 years). Lots of our emergency communications are with third world countries.
(5) It seems to be better than voice for communicating between speakers of different languages.

Finally, let me point out that I don't have a strong opinion on whether the above should force CW to be required for an HF license. I do STRONGLY support a CODELESS license for ALL VHF/UHF frequencies with full priviledges on those frequencies.

This extra class licensee says:

---DOWN WITH INCENTIVE LICENSING!---

[gee, I've been waiting 25 years to say that! ;-)]

I've travelled about the country quite a bit, talking to other Hams via open repeaters. I've never been asked to leave a repeater because I didn't belong to its club; nor have I been asked if I belonged to it or any other repeater group. In the rare occasions when I've wanted to do something other than the usual BS (such as a phone patch, for instance), I have always asked for and received help. Someone was always willing to dial up the number for me. I just can't imagine an area where there's the kind of squabbling over who can use an open repeater that I infer from some of the postings.

In article <26483@usc.edu> kjh@pollux.usc.edu (Kenneth J. Hendrickson) writes:

> After reading this R1 manual, I failed to spot any "delay" function, whereby an extra delay can be added to a simplex frequency, or a frequency with a repeater with a short hang time, so scanning won't resume until a response is heard. Does the R1 or the R100 have a delay function?

You can set the R1 to pause for 10 seconds and then continue regardless of any signal being present or to lock on to a frequency in use and only continue if the signal goes away for two seconds. Yes it would be nice to be able to increase this time.

> I also note the lack of "banks" for scanning, although you can set the lower and upper memory channel to scan between, effectively having 1 bank.

Yes the R1 does have 10 scanning banks with two frequencies, tuning step and receive mode settings for each bank (see pages 16 & 17 programmed scan). When scanning in this way you can just press a digit at any time to switch to that bank. You can also press MW (Memory Write) if you get a signal that you don't want; the R1 will then store that in a memory and ignore that frequency in future.

The R1 has in addition an upper and lower bound for scanning memory channels. When scanning a range of memory channels you can set individual channels to be skipped and you can do a mode scan whereby only memory channels set to eg. AM are scanned. In addition to this, you can set the R1 into priority watch while scanning memories and it will check the next memory channel in turn every five seconds.

> If Icom is planning for a future model with these features, or more memories, then I think they should be faulted for this also. They should just do it right the first time, corner the market, and take their profits right away. I'm a poor student, and although I would like such a receiver, even as it is, I can (and will) wait until something more to my liking comes out. :-)

I would like to be able to set a frequency on the VFO and then say ok scan up (or down) from here; I can only do that at present if the VFO frequency is in one of the scanning bank ranges and then it switches to the bank's mode and tuning step.

First...the system isn't in place, doesn't have approvals for spectrum usage, etc yet. Until it IS in place, it doesn't help solve the communications problems out in the boonies. It obviously will if it does become a reality.

Secondly...depending on any ONE system in emergency work isn't a great idea. Ham radio isn't the ONLY way to solve emergency problems, its just one of the answers....and will probably remain so. All of these systems are viewed as complementary by the emergency services using them...not in competition.

As for looking to other ways to justify our spectrum allocation, the emergency aspect SHOULDN'T be used as the only arguement...but it IS the easiest one for the general public to relate too, and will probably remain so as well.

The educational aspect that you mention is a good idea, and is being practically pursued last time I looked...the SAREX program is a good example. There is always room for new ideas, and new efforts in this direction though....got any good ideas on how to employ ham radio along these lines?

Voodoo Radio died out on the net some time ago, now we are getting a dose of Voodoo TV. Please look at any FCC TV allocation chart, or even think a little.

1) At VHF, TV channels in the same city may have as little as 4 MHz guard band between them: ie. channels 4 and 5; 66-72, 76-82 MHz. New York City has stations on chans 2, 4, 5, 7, 9, 11, 13, and UHF, for example.

2) At UHF, the percentage difference in carrier frequencies isn't a big problem for adjacent channels, since all TV sets are (surprise) superheterodynes! Front-end selectivity does affect image response, and helps a lot on some of the unwanted mixing products, of course.

3) TV sets can easily handle signals on adjacent channels, if their strengths are about the same. This how Cable TV channels are set up. 16,17,18,19,etc.

4) If all a town's transmitters were on the same antenna, you just might be able to use adjacent channels, see 3 above.

5) There are so many empty UHF channels since the FCC is protecting poor sets from all sorts of their own flaws: (from a few-year-old chart)

IF beat	20 mi. spacing	8th channel higher & lower
Intermod	20	2nd thru 5th channel higher & lower
Adjacent chan.	55	1st channel each side *
Oscillator radiation	60	7th channel higher & lower
Sound Image	60	14th channel higher & lower
Picture image	75	15th channel higher & lower

* The FCC doesn't make an exception for co-located stations.

Examples are: (all are full-power)

Channel	City	Channel	City
20	Washington	54	Baltimore
22	Annapolis	56	Fairfax, VA on DC Beltway
24	Baltimore	---------------	
25	Hagerstown	66	Manassas, VA nr Washington
26	Washington	67	Baltimore

68 Hagerstown

Well, maybe I'm not imaginative enough, but I'm pretty hard pressed to see how Iridium is going to hack it. Where have I miscalculated or made a grossly incorrect assumption?

The details refer to small satellites each serving 37 cells which are 360 miles across. If the satellite is small, where does it get a lot of power? Suppose it is covered with PV cells, maybe getting a couple of hundred watts for the whole thing. Can it really get much more than 10 watts or so to 1500 MHz RF?

10 watts among 37 cells is about a quarter watt/cell if the satellite can manage the antennas to optimumly direct the beams. This is not a particularly miniscule antenna at this frequency. A 360 mile/side square is about 3.35E11 square meters. Each square meter then catches 115 dB less power. That's about +24 dBm - 115 = -91 dBm. But at 1500 MHz a 1 meter square aperture antenna implies a gain of 24 dB or so and a beamwidth of about 10-15 degrees. If an omni antenna is used we lose all but a couple of dB of this gain.

Since these things are flying across the sky, for the gain antenna to work the ground end is going to have to do a lot of pointing. So we would have to come up with an (inexpensive) electronically steered array along with algorithms to find, track and execute handoff on the ground end. This steering must work on both receive and transmit. All this to get -91 dBM/(KTB) = 46 dB in a 5 KHz bandwidth (my number).

Considering the user data rates I'll assume the omni antenna case. The omni antenna is going to give only 24 dB of C/N. Actually it will be worse than this since it is looking at surrounding terrain at 290 K or hotter and antenna losses/receiver noise figure won't be perfect. Now we have maybe only 21 dB with the omni antenna and we haven't dealt with what happens when the user is in the 3rd ring of the clusters and the satellite is 3*360=1000 miles away. I did it quick but it looks like the satellite is only about 15 degrees above the horizon. If every user has an LOS shot above 15 degrees elevation, no wet trees or other problems to chew up more than a very few dB, I guess he gets his 4800 bps information rate, assuming no overhead in dispensing the bandwidth among all the users, collisions etc.

So, after the user has bought a *bunch* of hardware, made sure he can see down to a low enough elevation AND paid his share of the N billion dollar investment and maintenance for the system then he gets 4800 bps to use.

It seems like I saw an estimate of $2billion for the initial system. If after buying his ground station a user will pay $1000/year and it has to be replaced every five... it seems to take 400,000 users/supporters. Thats about 5000 users/satellite, 140 users/cell to break even.

I'm not convinced that the market will support that kind of service at that high a price.
Certainly in developed countries 4800 bps is going to sound pretty

meager by the time the whole thing is functioning.

> Ah the mythical HDTV! Don't hold your breath waiting for BROADCAST HDTV. The economics just aren't there. My company participated in the HDTV tests done for the FCC. We estimate it will cost between $20 million and $50 million to convert a television station to transmit HDTV. With an installed base of $50 billion in NTSC equipment and NO original HDTV programming (except some old "I Love Lucy" reruns that were shot on 35mm film--REAL HDTV) available to fill the hours, no

How many folks on here have SEEN real HDTV? Well I did last week, and I was VERY IMPRESSED! I was in Seattle Opera's production of War & Peace, which was being taped using HDTV. It was awesome. Between my scenes last week during the two days of taping I went out by the production trucks where they had a monitor set up. The only way I can describe it was like squeezing 70 mm film into a box. The aspect ratio was different, with a wider screen, and the detail was amazing. When the camera did a long shot of the entire stage, I could make out the faces of every individual member of the 80-odd chorus. The production folks are talking about possibly doing a film transfer for theatre distribution....it's that good.

For some reason though, the opera folks kept describing the process as "filming"!

At the university level one of the best ways to integrate amateur
radio is in an electrical engineering program. There probably aren't

many better places to put one's communications theory, dsp, microwave, circuit design, etc courses to work. If the code requirement was relaxed it would be possible to funnel students through a "ham radio lab" to get licenses in their sophmore year. If we choose to continue chasing public service one could always get the student volunteer ambulance corps types interested in FEMA, etc.

I don't know what goes on in high school these days, so I have no suggestions on how to capture those kids. Just to take a wild swing, perhaps if we get the content rules under control such that every other response to a message isn't "We shouldn't talk about that, FCC rules..." perhaps the BBS aspects of packet would interest HS kids, ie Radio Compuserve.

It would seem possible to catch kids in elementary/junior high with satellite applications, or remote control/telemetry as applied to robotics. Or possibly exchanging pictures via satellite packet with their peers in other countries.

Generally speaking, people seem to be interested in video these days; it might be possible to snag people at all levels if they could be their own low power TV station to tie in with the desktop video/vcr/ home entertainment angle. Or maybe a year 2000 pacsat with video compression & storage such that it could forward video messages, ala picturephone mailbox.

If we ever get the packet data rates up to the point where decent applications can be built, then we can start to look at things like making "telescope servers" (move telecope to point, digitize picture, send packet picture back), weather sat servers, network of weather stations for realtime data collection, remote HF rcvrs for propagation studies, paperless multimedia AR magazines (see the fellows station, listen to audio clip of him contacting DX, etc).

> 1) What is MCW ??
> 2) Is MCW = AFSK RTTY = F2B ??
> 3) What is FM Telegraphy using on/off keying of an audio tone fed into the
> input of the microphone ?.

MCW can be a number of different emission designators. The FCC attempted to categorize the designators rather than have to code them all individually into the rules (there are a LOT of possible combinations we want to be flexible to try).

97.3(c)(4) MCW. Tone-modulated international Morse code telegraphy emissions having designators with A, C, D, F, G, H or R as the first symbol; 2 as the second symbol; A or B as the third symbol.

For those of you who use regexps: `[ACDFGHR]2[AB]`

97.3(c)(5) Phone. Speech and other sound emissions having designators with A, C, D, F, G, H, J or R as the first symbol; 1, 2 or 3 as the second symbol; E as the third symbol. Also speech emissions having B as the first symbol; 7, 8 or 9 as the second symbol; E as the third symbol. MCW for the purpose of performing station identification procedure, or for telegraphy practice interspersed with speech. Incidental tones for the purpose of selective calling or alerting or to control the level of a demodulated signal may also be considered phone.

Regexp: `([ACDFGHJR][123]|B[789])E`

Notice that what might be considered MCW would be considered "Phone" for the purpose of being legal. Thus where MCW is NOT legal but Phone is, you can go ahead and use MCW for the purposes mentioned in 97.3(c)(5).

> you get good long distance communications during a high sunspot number
> when ionization is at maximum ?????

The absorption is responsible for making the lower frequencies less usable
during higher ionization. But at higher frequencies, the higher ionization
actually brings about enough bending to make long distance communication
possible.

There are TWO things going on at the same time. Absorption causes lower
frequencies to be less usable. The bending angle is also greater and the
skip distance is therefore lower as well. The greater bending angle is
also making the higher frequencies now usable.

The cutoff at the higher end is rather abrupt (MUF), and is quite gradual
at the lower end (LUF). Unfortunately this is only a simple explanation
for a complex subject.

When were you last in England? This past May I was surprised to
find temperatures usually quoted in F, speeds in mph, and all the bad-old-
units still in wide use. Australia and New Zealand were thoroughly SI (not
metric) back in 1973; much more than England today.
  > So get ready to fire up the arguments to support a measurement

Here is a reprint of a review of the Icom IC-228H posted August 1988. Since that time, I have enjoyed using the 228H daily without trouble, and the older IC-28A still works flawlessly. Icom just introduced the IC-229, a smaller version of the IC-228, so you can probably get a 228 at a reduced price.

PRODUCT REVIEW: ICOM IC-228H 2M TRANSCEIVER

by Bob Parnass, AJ9S

My Icom IC28A performed very well, and giving it to my wife afforded me the opportunity to buy another 2 meter radio.

What do I look for in a 2 meter transceiver? Being a scanner enthusiast, I look for wide frequency coverage on receive, and reasonable scanning facilities. Reliability and ease of obtaining schematics and parts are important, and Icom, Kenwood, and Yaesu score well here.

I prefer 25 watt radios to 45 watt radios for a few reasons:

1. I believe manufacturers overrate their transmitters' power specifications. Most models use hybrid modules for the driver/final amplifier stage. As a recent QEX article points out, the hybrid modules are only 25% - 50% efficient, which means the bulk of the power is dissipated in the form of heat.[1]

   The heat sinks on today's radios are just not big enough to dissipate the kind of heat developed during my typical QSO (conversation). The heat sink on my old 25 watt Motorola MetrumTM never got nearly as hot at the heat sinks on late model 25 watt Japanese radios. My 25 watt Kenwood TR-7800 and IC28A became very hot during QSOs. Pity those who bought Kenwood's "45 watt" TM-221A transceiver. It's not until they read the owner's manual that they learned Kenwood recommends against transmitting for more than 1 minute out of 3.

Heat shortens the already finite life of the hybrid modules, and I've been forced to replace these modules on various radios, to the tune of over $55 apiece (not including my labor).

2. It's easier to find power supplies for 25 watt radios, because they require only 6 - 7 amperes, versus 9 - 10 amperes for their 45 watt counterparts. The smaller power supplies are less expensive and are easier to find surplus.

3. Signals from 25 watt transmitters are almost as strong as those from 45 watt radios.

The IC228A/H series is Icom's replacement for the IC28A/H two meter radios. The tradition of offering two models at different transmitter power levels continues, with the 25 watt IC228A and 45 watt IC228H.

The IC228 contains a single VFO, and 20 memory channels. All the memory channels behave the same, as contrasted with some Kenwood designs which limit the flexibility of certain memory channels, while permitting special operations with others. Each IC228 memory channel can store receive frequency, CTCSS tone, transmit frequency offset, and scan list lockout.

Unlike Yaesu radios, the IC228 comes equipped with a synthesized CTCSS (PLTM) tone encoder, which is almost a necessity for using repeaters in the Chicagoland area. Any one of 32 tone frequencies can be selected from the front panel, and associated with a memory channel or VFO.

Repeater offsets are selectable from 5 KHz through 10 MHz, and can be stored in memory. You could conceivably store 20 different repeater frequencies in the IC228, each with a different offset and tone.

I wanted the 25 watt IC228A, but only IC228H models were available at the time. I'm glad I bought the IC228H high power model, because an internal potentiometer made it easy to reduce power output from 45 watts down to 25 watts. The large heat sink affords extra cooling capacity, and the final amplifier should last longer. Even so, the heat sink becomes too hot to hold during a moderately long QSO! Heat is eventually transferred from the heat sink to the entire radio case, making the entire radio "untouchable."

The major changes in IC228 circuitry from the IC28 design involve the microprocessor. The RF circuits remain similar, using the same transistor lineup in the transmitter stages and the now familiar Motorola MC3357 IF detector/squelch chip popular in scanners.

Icom took cues from the Kenwood TM2530 series to improve the LCD display panel and make the front panel controls visible in the dark. The display on the IC228 makes use of colored backgrounds for various fields, and is easier to read than the display in the IC28.

Unlike the IC28, the IC228 emits a beep tone each time a key is depressed. Although some people find this feature annoying in walkie-talkies, the beeps make it more convenient to operate the IC228 while driving. Icom recognizes freedom of choice, and permits the user to disable the beep.

The volume, squelch, and tuning knobs, as well as several buttons, are now backlit - an improvement over the IC28. The IC28 contained a photocell which automatically varied the LCD backlighting with changing ambient light levels, however the newer IC228 permits the user to select from 4 fixed levels of backlighting.

There is no free lunch, and Icom fans had to give up something in exchange for the new control backlighting: the plastic front panel and tuning knob on IC228 feel chintzier than the metal panel and rubber padded knob on the IC28.

Another new feature is a "lock" pushbutton, which disables the radio's front panel controls. I haven't found this as useful as the lock slide switch on the DTMF up/down microphone. The up/down pushbuttons on the microphone can be bumped accidentally in the mobile environment, and the slide switch prevents unplanned frequency changes.

The IC228's scanning features are on par with, or slightly above those of other 2 meter transceivers, but not as well implemented as in "real" scanners. The IC228 scans at the same speed as the 28 - rather slowly. A reasonable memory scan, with channel lockout, is provided. This is an improvement over the early Kenwood TH-215 walkie-talkie memory scan, which lacked a lockout feature, so one was forced to scan ALL channels.2

The timer operated scanning in the IC228 causes the radio to resume scanning 2 seconds after the carrier drops, or after 15 seconds - whichever occurs first. Too bad the IC228 lacks a carrier operated mode, like the feature in the Kenwood TM2530, so the receiver would "stay put" until the carrier drops.

The IC228 includes the ability to search between 2 frequency limits, and users of the American versions can select tuning steps of 5 KHz or more. The search limits are programmed into a special register pair, so they don't tie up memory channels. The search will pause as soon as the squelch opens, which usually brings the receiver to a halt off the center of the station you want to hear. Unfortunately, Icom didn't adopt the Kenwood "center tuning" or Bearcat ZeromaticTM feature, which forces the searching to stop right on the center frequency. The Bearcat window detector circuit employs operational amplifiers, fed by the discriminator signal, to generate a logic level when the receiver is tuned within 2.5 KHz of center frequency.

When the IC28 was first introduced, it was offered with either the standard or DTMF microphones, at two different prices. Apparently, most people wanted DTMF mikes, and a DTMF microphone is provided with the IC228.

Except for the high heat sink temperatures, the IC228 performed well during a recent cross country trip. With the radio bolted to the center console of my truck, the receiver audio output was ample, the display easy to read day and night, and stations in Pennsylvania and Ohio praised the transmitted audio quality.

I'm pleased with the IC228, and recommend it.

---

1. See "RF Hybrid Modules: Building with Bricks," by Bill Olson W3HQR, in July 1988 QEX.

2. Late vintage Kenwood TH-215 walkie-talkies now come with upgraded firmware which permits channel lockout. A new CPU chip may be retrofitted into earlier units, but Kenwood charges for this service.

This information from Lawrence, 5B4SA, last night on 20M. One of the
Kuwaiti 7O1AA operators, Mohamed, was killed in the invasion of Kuwait.
He is reported to have been a member of the Kuwaiti royal family, a son or
brother of the emir.

About a year ago, a version of Morse Tutor was posted out on the IBM-PC binaries group. Unfortunately, I seem to have lost the d*&n disk where I had the archive stored. Can someone please tell me if an archive is available for this via anonymous FTP? Thanks in advance!

Oh, if you are interested, there is a DXTRAKER posted out there recently that I just tried out and it works really nice... a Windows format with DXCC information built in (and can be updated), keeps tracks of which zones and countries you have worked by band and mode, allows for printing lists and such.

Scott: I tried to send you e-mail, but your address didn't take. The mod works great! The Alinco is one GREAT radio. I did notice that when I had a 450 mhz AND a 850 mhz frequency in the two displays, that the radio would only hear one of the signals at a time. If 850 was the primary frequency, then the 450 would squelch when a 850 signal came on. Can you tell from the service manual why this might be? Is there one front end PLL circuit for both of these bands, and only one can be heard at a time? My only criticism of the Alinco is that for all the frequencies it can hear, it would be nice to have more memories. I noticed that the 850 channels get memorized in the 2-meter bank of channels, which I guess is a function of the switching of the 2-meter band for the 850 band.

I'm so impressed with the Alinco, that I'm considering a DR-510 for my other car. I know that its style is similar to the DR-110T, but does the 510 have a similar mod to open up its coverage. The DR-110T has a little yellow wire on the top left aspect of the radio which, when cut opens up the receiver for out-of-band coverage. Is the 510 likewise modifiable, and will it open up the UHF receiver spectrum?

Thanks again for your help with the 570!

I just talked to someone at Antenna Specialists. He said that if you have an aftermarket tint you should cut the section out. Otherwise, he claims 3dB gain over 1/4 wave.

If anyone knows anything bad about this antenna, please let me know, too. I am about to buy one soon.

Thanks

Methinks you want the FT-101EE rig. This is what I have. The three models (at least as of the date on my manual) ate the B, EE, and EX. I know the EE has all the bands (the B and EX lack some I think), but I'll have to look in my manual in order to tell you what all the differences are. There's a nice table listing various features/bands, which rigs have them and which don't. I try to drop you mail this evening listing the info.

I don't think the CW filter came stock on any of them; mine has it, but the manual gives installation instructions. Try Fox Tango for the CW filters.

I gather that you're considering the purchase of one of these rigs? If so, here's some info on going prices in the central New York region. I bought my FT-101EE for $390, mint condition (looks like it just came out of the shipping carton), good finals, plus a set of new finals and CW filter. Only problem: one xtal bad, replacement cost $5 plus shipping from Yaesu. I got a 300 watt Drake MN7 matching network (with SWR/power meter) with it for $80 additional.

At a hamfest this past Saturday I saw an FT-101EE for $375; it was in "fair" condition cosmetically. I also saw an FT-101B at $325. It was cosmetically "poor", and looked like it had had several of the front panel switches replaced with non-stock switches.

Good luck! The FT-101's were (and are) great rigs.

Well, this certainly seems to address alot of of the issues surrounding cellular phone service. Kinda kills the objection about cells getting knocked out during natural disasters, doesn't it? As a friend of mine observed dryly, "if we have a natural disaster that makes it impossible to talk to an orbiting satellite, a 2 meter HT probably ain't gonna do much good either. We're talking serious atmospheric ionization here." :-).

Anyway....

In anticipation of the "it'll never work" discussion that I know (and the reader should know) is coming, I would like to present today's Top 10 List with apologies to Late Night with David Letterman....

From the Home Office in Scottsdale, Arizona....

Top 10 Reasons Why Hams Think Motorola's Iridium System Will Never Work...

10. Can't buy equipment from major Ham equipment manufacturers.
 9. All those 900 numbers lead to undisciplined use of spectrum.
 8. No allowance for use of CW in "high noise" environment.
 7. Uses "evil" DSP techniques.
 6. Not available in HeathKit version.
 5. No exam required for upgrade.
 4. Wrong numbers won't understand when you shout "CQ DX" at them.
 3. I TOLD YOU this would happen when QST did away with "The World Above 900 MHz!"
 2. It's yet another example of the "appliance operator" mentality.
 1. Takes all the "challenge" out of global communications.

Flames to /dev/null please.

From: karn@envy.bellcore.com (Phil R. Karn):
>

> Okay, then why is it standard practice in the telephone business to
> supply battery power for telephone switching machines and transmission
> equipment when it's needed only a tiny fraction of the time?
>

I think there are several reasons for their forethought.

First, Ma Bell and her offspring have been around forever. They invented the telephone system and have kept it at the forefront of technology ever since. Until recently, they were a monopoly that existed by the grace of the government, and they wanted to preserve that status. Even now, they remain a monopoly at the level of the CO. Part of being a good telephone monopoly was and is to provide top service to the customers, and that includes the ability to function under adverse conditions that were foreseeable.

Second, it makes very good business sense for the modern wireline telco to preserve this tradition of dependable service. One of the programs that makes lots of money for the baby bells is 9-1-1 in its various forms. Now, it would look really poor to the towns and counties thinking of buying into 911 if the underlying phone system were prone to failure on even a rare basis. When fire or a police dispatchers lose their phone, they get upset really fast. They are not at all willing to tolerate a phone system which is down whenever the mains power goes away for more than a short (UPS time range) time.

There are many other customers of the wireline telco that DEPEND on VERY dependable service over the phone. Not the least of these are the everyday homeowners that want very much to have a phone when the power goes out. All together, there are good business reasons for the CO to have a very dependable power source.

I don't believe that the average cell phone carrier is so motivated. There are few businesses or public safety agencies that I know of that DEPEND on the cellphone system the way that they do the wireline system. Neither are the cellular carriers monopolies in any of their service areas (even if there is only one carrier, it is only because of a market too small or unprofitable for a second to share it.) The world does not stop when the cell phone switch goes down, the way it does for the wireline phones.

Also, most of the cellular companies came into being at a VERY competitive time in their markets; the Bells were a formidable competitor. The budgets under which these systems were conceived and built were much tighter than the conditions prevailing as Ma Bell expanded the wire phones across the land. The result is that smart business in the time and service of the cellphone is much different than that of the wireline phone.

> I would argue that most amateur radio facilities are nowhere near as
> well maintained and backed up as the average telco facility.

Absolutely no argument here. However, the ham "system" has as many levels of redundancy as there are hams with radios. Can you touch that? I doubt any system can. (let's not discuss CBs...)

> Phil

I don't think we disagree, Phil.

A common cause of TVI is the TV antenna feedline acting as an antenna. Large common-mode RF currents flow on the outside of the coax shield down to the TV where they enter the tuner, completely bypassing the high-pass filter you installed.

Is the TV feedline coax-type? If so, you might use a TWINLEAD-type high-pass filter with baluns on each end. This breaks up the shield connection. Or use a coaxial filter with a pair of baluns connected back-to-back at its input or output.

While there probably has been some whining on the subject, there has also been legitimate questions as to why CW, out of all the various communication modes available in ham radio, is considered necessary. I accept the fact it is needed due to international treaty, but have yet to hear any other good reasons.

Others also complained of my lack of statistical rigor. I admit to not considering the code/no-tech and tech/no-code combinations, since there is no US experience (see below). I omitted one or two no-code/no-tech (unlicensed) people from the AMSAT and CSVHF numbers, sorry.

I suspect that the data, not my lack of rigor, displeases you.
I don't think I ever claimed that high-tech people are ATTRACTED to ham radio by the 13- 20-wpm CW requirement, but I do think that I demonstrated that amateur radio technical leaders usually are proficient in CW.
Are you unwilling to concede this?

I had expected that Technicians would show up in much greater numbers.
If I had found that any substantial number of the technical leaders were Techs or Novices, I would agree that CW is so offensive to techies that they just learn the barest minimum CW and it is a serious hurdle. Do you suppose that the distribution is bimodal - most high-tech hams find CW no big deal, but most high-tech non-hams are kept out of ham radio by the code?

The British have issued no-code licences since 1964. Has their no-code licence brought in a lot of techies? I looked through the Feb, Mar, Apr, May, Jun and Aug 1990 issues of Rad Com (the main G ham mag) (can't find July) and find the following breakdown of authors of their (generally good) technical articles:

Class A (code)	18	
Class B (no-code)	1	(~ half of all G's are Class B)
Unsigned Q&A Article	1	

Also, the Brits are so concerned about the aging of
THEIR ham population that they have announced Novice licencing.
I'm not convinced that the British no-code licence has brought in either:

1) lots of young people, 2) lots of high-tech people.

                  ^^^^^^^^^^^^^^^^
Yes they do, pretty strict ones at that... But they, like other gun control
laws only effect the law abiding citizens. Do some research into the Stockton
massacre, and gang warfare.

>--Phil Howard, KA9WGN-- | Individual CHOICE is fundamental to a free society
><phil@ux1.cso.uiuc.edu> | no matter what the particular issue is all about.

But back to the subject... On a recent trip to the bay area, I got a heavy dose of the "private" rptr nonsense. I won't go into the details, (I don't even want to remember) but I will never bother carrying a radio to Ca. again. For the same reason & others, I will never live in Ca. if I have any way to avoid it. I know there are good hams in Ca. (many I see on usenet) However, it appears that the ham resources there are dominated by a different type of ham, and it is tolerated.

It is amazing to me that in every other state I have operated in, that common sense prevailed. A rptr operator can make it difficult to use his machine, can turn it off at will, etc. .... But he cannot say "You cannot talk on this freq".

Personally I feel once he turns off his machine, he has vacated the frequency.

I do not agree with malicious interference, but using a freq (input or output) that is *not in use* is not malicious interference.

I take this approach on my machines, and expect other operators to do
the same.

I bash NJ alot, but even they are better in this aspect.

Durnit!!! I allready spent more time than I feel this subject is
worth. Oh well!

>>Now we have two grounds internal to our circuit board.
>>What do we do with them?

>Tie them together at the power supply, or as close to the power supply as
>possible.

You might also want to put chokes on the supply and ground lines
between the power supply and the analog side of the circuit. The size
of the chokes, or the design of an RLC filter, will have to be chosen
according to the frequency distribution of the noise that you're
trying to eliminate.

I often use something like

```
    +---- Digital +5
    |
+5-----+---- 100 ohms ----+---- +5 to analog components (3130,
                |               ADC0808, etc.)
```

```
              10 uF and .01 uf in parallel
                 |
GND-----+---- 100 ohms ----+---- Analog ground
     |
     +---- Digital ground
```

Add similar stuff for +12 and -12 if you have them. This is all fine if all your analog stuff is ultra-low-power; the extra hundred ohms doesn't make a difference. Since I use 3130s, 3140s, TL08x, ADC0809, LF11201, and similar MOS parts quite heavily, I don't hasve to worry much about having a low-impedance power supply.

I'm trying to convince GTE California to change our repeater's phone patch line from a business rate to a residential rate. Does anyone have any ammunition to bring to bear that I can use in waging this little war? Currently, they claim ignorance on the issue. The operator I got there had to refer things to her supervisor and claimed it would take at least a week to research the issue.

Thanks for any input, FCC regs, whatever.

>Now we have two grounds internal to our circuit board.
>What do we do with them?

Having two grounds may or MAY NOT result in a significant reduction in logic noise coupling into the analog circuits; a well-designed single-ground-pland board can be made pretty noise-free as well as a dual-ground scheme. However, if you're set on separate grounds, they obviously must tie together somewhere - assuming, for example, that the logic section provides control signals for the analog section, they won't be able to talk to each other unless they either both think "ground" is the same or you use differential drivers/receivers for the control lines. (One other option might be to couple the two sections *optically*, but that's probably only viable if the number of signals is fairly low. But it'd be a very nice way of getting lots of isolation from noise.)

The grounds may be connected either on the board, perhaps via some ferrite-beaded jumpers at several locations, or back at the power supply or motherboard (if you have one). One problem which I've seen with the ferrite-bead connection comes up if you have any very fast signals crossing from one side to the other - these can put enough impedance in the loop so as to start to screw up reliable signal communications. On one board I recently worked on, we wound up with simple wire jumpers in place of the ferrite-beaded ones - it seemed that just the little bit of wire provided sufficient inductance to hold down the high-frequency noise we were troubled with, but not enough to separate the two grounds significantly for the fast logic signals. Leave yourself several options - places for jumpers, etc., and you might even consider hooking the two grounds together via some fairly heavy traces, which could be cut to go from a single ground plane to separate planes.

>   Ed Gilbert
>   WA2SRQ

Rohn makes such a device for commercial towers. It consists of a
cable that runs up one of the legs from top to bottom supported by
posts that hold the cable about 1" out from the leg. You clip a
device to the cable when you start up and it runs along as you
climb; however, if you fall, the device will lock.

This is something the tower owner must install, it isn't something
a tower climber could temporarily install.

My friend uses a short length of chain with a hook on the end that
he moves as he clibs. I find this gets in the way and that I am a
safer climber if I just do it free style (I think you will find that
most pro's do not attach themselves until they get to a fixed location).

>one is going to broadcast it on a regular basis.

Your company's analysis was SERIOUSLY flawed. It sounds like the arguments against CD's, rehashed. Remember, there was "no installed base" for CD's because "there are no disks to play". Many people would move up to HDTV (real HDTV, not the low-res stuff the FCC says they MAY allow) receivers to take advantage of the higher display resolution, even on less than full-screen, for laser disks (which are coming back), S-VHS tapes, and computer displays. Heck, what was the installed base for TV in 1940? Couldn't we have saved that bandwidth for radio (commercial, military, amateur, etc)?

Why not reallocate the UHF band? Retain, say, channels 14-59 for NTSC and reallocate 60-88 for FULL-BANDWIDTH HDTV, adjusting the spacing as required. The channel conversion costs, including promotion/information to inform consumers of the change, could be subsidized from the license fees payed for the new HDTV channels. The gov't could sell bonds financed by the license fees, and perhaps, an excise tax on HDTV receivers. This way, the relatively small cost to change the broadcast channel isn't a burden on small stations, and the current investment in receivers isn't obsoleted overnight. As the demand for HDTV rises, additional UHF bandwidth could be reallocated. Commercial stations might even "simulcast" on NTSC and HDTV like they (used to) do on FM-AM. Probably using lo-res sources initially, but later using hi-res sources, converting down to NTSC.

As for the lack of programming, there are already HDTV setups for live sports. Live and taped concerts, especially pop, would sell commercial time well. And picture 70MM movies broadcast over HDTV, which also has hi-fi sound!! Other programming could be broadcast with blank, color, or (shudder) commercial messages in the side-bars.

Every advance in consumer electronics, TV, color TV, stereo radio, etc., has been attacked by a combination of vested interests and "Luddites".

Why should the consumers in this country be penalized, when Europe and
the Far East are already finalizing HDTV plans?

>>--Phil Howard, KA9WGN-- | Individual CHOICE is fundamental to a free society
>><phil@ux1.cso.uiuc.edu> | no matter what the particular issue is all about.

Please re-read your own signature. If the FCC is allowed/encouraged to
snuff real HDTV, what happens to MY (and others) choice? Don't we have
an interest in the RF spectrum?

By the way, I'm not a licensed amatuer. I saw the HDTV posting over a
friend's shoulder. But, please notice that I have NOT advocated or defended
grabbing any of "your" bandwidth for "my" uses.

Using QEX as a statistically significant sample is bogus. I just learned
about QEX two months ago, long after upgrading to Advanced.

On the other hand, I have no better measures, other than perhaps contest
results.

If you reread Brian's original posting, you will find that he said
for "weak signal" work he would use DSP. He didn't say he would use
DSP on weak "CW" signals. In fact, CW is not particularly well suited
for weak signal work since it doesn't retain phase coherence from
pulse to pulse. Slow PSK is a much better choice for really weak signal
work as witness Voyager.

Has anyone any experience with the Alinco DR-570 dual-bander? I bought the radio and it seems to be GREAT. It comes with extended receiver coverage on high band, and it has as a standard feature cross-band repeat.

Does anyone know how to extend the receive coverage on the UHF side, to allow reception above 449.995 mHz?

This may be true on paper, but in practice, amateurs >use< CW (and phone,
and packet).  One has to build up a clientelle for anything else, and
>that< is the real challenge.

We're working on it... it's called anti-irrelevancy-licensing, more
conventionally known as "no-code".

First thoughts might be to suggest using heavy duty tubing, and make a slot antenna. Feed it from the inside, vertically, and seal it up tight. I've never tried it... it's just a thought off the top of my head.

> The reason I used the word "toothless" is that the FCC is very reluctant to get involved in repeater coordination wars. There have been several cases where there were battles between coordinating bodies. The FCC stance has been to either stand aside and recognize BOTH groups (which is, of course, absurd, but happened in Sourthen California) or to ask for a vote of the USER COMMUNITY (I believe this was suggested in Kansas City)!

Most repeater owners apparently do not want this kind of "outside" influence.

> Note that current coordinating bodies (such as the one here in AZ) are

> usually controlled by existing repeater owners, who have a clear
> conflict of interest in their position. Some years back I discussed

> of the USER's must be considerd in coordinating decisions.

The USER's, which also include potential operators of newer repeater systems,
definitely have a vested interest in how the spectrum is used or wasted.

The FCC would be in a terrible position of taking away our frequencies
just because of the low density of repeaters *IF* we indicated that we
COULD have made use of the spectrum had they let us.

>   So, if someone wants to cause trouble (or maybe even do some good,
> although I don't generally like such tactics), they can set up a
> competing coordinating body that refuses to recognize the closed
> repeaters. If they are clever, they will appeal to the USER community (which,
> of course, does not have a large percentage of closed repeater users) and
> maybe win FCC recognition OVER the old coordinating body.

One could TRY to work things out from the INSIDE. But that is very difficult
with organizations that restrict their membership to owners of coordinated
repeaters. The savvy coordinating group will open up its membership to all
amateurs.

> As the need for frequencies gets more intense, more of these disputes
> will arise. Today, there are many frequencies, throughout the country,
> that are RESERVED for tiny groups with a few members. Also, there are

> to experiment with trunking technology (which would greatly relieve
> band congestion)? Where do they get the frequencies? How about
> digital modes (packet, digital voice, TDMA digital voice, etc)?
> Why should almost all frequencies be tied up so that these private
> groups can occasionally use a quiet FM frequency?

There is of course the CURRENT 220 problem. Assuming the FCC decision to
take away 220-222 Mhz is not reversed, which is a distinct possibility,
the remaining 3 Mhz needs to still be shared. But the question is how to
share it. Are we going to take away 40% from each type of usage across
the board? What will coordinators tell repeater owners? Will we have
40% fewer repeater channels or will we reduce the channel spacing (which
might be hard since I understand SOME 220 Mhz are stuck on 20 khz spacing).
Are there any groups who demands on the spectrum will go down?

This situation might actually force us to learn, as a group, how to make
better use of spectrum. If we take advantage of the learning, we can also
make expansion of the who amateur service work, and perhaps save most of

the rest of our spectrum.

> .ps using the pbmplus toolkit.   Share and enjoy.

The path to the file is pub/R1.tar.Z

For those of you using BSD UNIX or close enough compatibles, one command can snarf it up and make the R1/*.ps files directly:

```
echo 'user anonymous yourid@your.host\
binary\
get pub/R1.tar.Z "|zcat|exec tar xvf -"\
quit' | ftp -nv 36.14.0.30
```

The uncompressed files tape up 4.4 megabytes of space. The compressed file is only 600 kilobytes.

The "exec" in the above command reduces your swap space demands by have one fewer process sitting around doing nothing (the shell that ftp starts to invoke the pipeline). Some systems have a smarter shell that will do this for you anyway, and some others have a dumber shell that won't at all.

I don't quite agree.  While it may not be good operating practice, and may
even be eligible for NOV on that grounds, it is not interference unless some
other communication is actually interefered with.  Simply arranging to
carry on a simplex QSO in such a way that a repeater will play it out for
all to hear on another frequency is not interference.  If that repeater
has an ongoing QSO, then it is.  If that repeater's output is interfering
with something else, and IF YOU KNOW THAT and operate anyway, again that is
interference.

Quoted from the telecom digest/newsgroup:

From: contact!ndallen@uunet.uu.net (Nigel Allen)
Newsgroups: comp.dcom.telecom
Subject: Coastal Telegraph Stations
Date: 8 Aug 90 00:39:00 GMT
Sender: news@accuvax.nwu.edu
Organization: Contact Public Unix BBS. Toronto, Canada.

Before INMARSAT began to provide satellite radio service to ships at sea, the only way to send a message to a ship was through a coastal radio station, either by voice or by telegraph. (I think that teletype service was available through Rogaland Radio in Norway, but not in North America.) INMARSAT is quite expensive ($12 per minute from Canada), but even so coastal radio stations are closing down in the U.S.

{Popular Communications} Magazine reports that Western Union has filed with the FCC to shut down its coastal telegraph station KFS (location unspecified), and that some other coastal telegraph stations, WPA, WOE, WMH, WSL and KOK (locations and owners unspecified) have already been closed down.

In the foreseeable future the FCC is going to pontificate on the No-Code question. When that happens, what will the sclerotic and gasping old farts have left to whine about?

May I suggest a new cause? How about the Metric system? I am sure some of our usual correspondents can generate reams on why its no good, how it will never work and how you can succeed without it.

May I kick it off by pointing out that it was introduced by Napoleon in 1801 and is now the usual system of measurement in all countries except the U.S., Brunei and maybe another couple of fiefdoms.

The connection here is that most countries have No-Code except the U.S., Bermuda, Jordan and a few other fiefdoms. I find amazing similarities between these two subjects. They also both concern change and future technology.

So get ready to fire up the arguments to support a measurement system inherited from the British and generally known as "Imperial Measure".

I tell people to *always* take all the tests they can. This means take all the written tests up thru extra until you don't pass one. You might surprise yourself! It doesn't cost any more. As for the code, try the 20 and then the 13 too before dropping down to the 5. Even if you flunk the other two, you can take the 5wpm. Again, you might surprise yourself. Or just consider the faster tests to be a warmup. This helps get you familiar with the testing process, the code tapes they use, etc. If all you expected to get was 5wpm, by the time you heard 20 and 13, 5 will be a piece of cake.

After reading this R1 manual, I failed to spot any "delay" function, whereby an extra delay can be added to a simplex frequency, or a frequency with a repeater with a short hang time, so scanning won't resume until a response is heard. Does the R1 or the R100 have a delay function?

I also note the lack of "banks" for scanning, although you can set the lower and upper memory channel to scan between, effectively having 1 bank.

Icom may have done something significant in producing a very small wideband receiver, but they have ignored things that other manufacturers have learned concerning the user interface. I think they should be faulted for this. There is no reason that this scanner can't have these very useful features, probably just by re-writing the firmware.

If Icom is planning for a future model with these features, or more memories, then I think they should be faulted for this also. They should just do it right the first time, corner the market, and take their profits right away. I'm a poor student, and although I would like such a receiver, even as it is, I can (and will) wait until something more to my liking comes out. :-)

DOVE, the Digital Orbiting Voice Encoder microsat seems to be steadfastly back on 2m now. But the telemetry packets have two fewer channels than before. Does this mean that the whole set of telemetry channels has been changed or reorganized or that just the last two (related to the S-band xmtr) have been dropped? Also, is there a new set of telemetry equations to go along with the new format? There appear to be more non-zero values in the status bits now too. Is there an up-to-date description of what they all mean? Many thanks in advance for any help anyone can offer.

>Does anyone know how to extend the receive coverage on the UHF side, to allow reception above 449.995 mHz?

>Kirk Baxter, N0FPZ

I just purchased the DR-570T also. This has got to be the most full-featured dual-band mobile on the market. I am impressed with the unit, not so much the user manual. A service manual is available from Alinco for 10 bux.

There are many undocumented features especially in the "repeater mode". Alinco claims that you can ONLY repeat from the VHF VFO to the UHF VFO and vice-versa. No PL or CTCSS decode or offsets....... wrong! (pleasant surprise!). You can repeat from memory to memory or vfo to memory, CTCSS, PL, and offsets can be included. The DR-570T has DUAL CTCSS decoders and encoders (a paid option on the new upcoming DR-590T)! Also, all of the usual panel controls are live while in repeat mode so you can change paramaters while in the active repeat mode.You can also pick up the mike and join in on the QSO in progress!. Even the up-down buttons are still functional making remote control with a homebrew DTMF decoder a reality.

As far as out-of -band enable, just pull off the top cover, place the radio with the knobs facing away from you. Locate the logic board behind the front panel. Towards the top middle of logic board (in the unsheilded area) are three white color jumpers, the one on the left tilts about 45 degrees. You want to cut the last jumper on the right (about mid-front panel). Replace the cover. Turn on the radio with the Function key depressed. The rig will now have to be re-programmed. Frequency range Rx and Tx : 130Mhz-170MHz, 420Mhz -470MHz. Rx only: 335-385 MHz and 850 Mhz to 890 MHz. No re-alignment is needed for these ranges. Power out is about 15-20 watts at the extreme edges on UHF with receive sensitivity dropping off to no worse than about 1 microvolt at the edges. I didn't measure VHF yet...

I questioned how questions about what element designators (1a, 3b, etc) are required for what lisence would help ensure legal operation of your extra class station (the supposed purpose of the legal section of the exam).

Several people pointed out that one of the priviledges of the Extra was to be a VE, so you should know these things. I just got my 610 in the mail yesterday, and all of the elements required for each class are printed right on the form. Since it is apparently impossible to excercise the VE priviledge without someone handing you a 610, I say again: Is there any point to memorizing yet another list?

How about the new system of emission designators, when right in the ARRL edition of the rule book they say that the fcc has gone to english descriptions because the designators are too restricting, and really pretty pointless anyway.

Again, I am not saying "They shouldn't ask these because they are too hard," I am saying they shouldn't ask them because they are useless, and they displace questions that could be more relavent.

I suppose I should really be venting this steam towards the ARRL. Maybe after I take the test.

EMP is the *basis* of CW requirements? You must be pulling our legs, right? I don't believe any country had the capability of detonating a nuclear device a few kilometers over your head when the CW regs were first put in place.

Lets face it, most Hams, CW ops or not, would probably head for the nearest HRO after they get hit by lightning. I see no reason why knowledge of CW would have any bearing on a person's ability to homebrew a rig after a big one hits.

Ahhhh, I know, after the EMP hits, the CW op would find an ignition coil from a '48 Ford that has not been zapped, look for some iron filings to fabricate a coherer with, and communicate using ..... SPARK! :-)

The R1 has two scan continuation modes; the default is t-10, where scanning
continues after ten seconds of channel carrier.  The other mode (which I use)
continues scanning after the carrier drops AND two seconds pass (p-02).
So, it does indeed have a delay function.

From article <30500660@ux1.cso.uiuc.edu>, by phil@ux1.cso.uiuc.edu:
> Think about where the AUTHORITY of a coordinator to deny a coordination
> SHOULD come from?

The coordinator's authority ideally comes from the consent of the governed (sound familiar?). If the operators (not necessarily OWNERS) of coordinated repeater systems consent to the recommendations of the coordinator, there is no problem.

As soon as the bulk of the operators stop cooperating with the coordinator, they stop cooperating with one another by definition. They have only themselves to blame for their own mess. Too bad.

Violins on sale here, now. Crying towels in the dispenser behind you.

No, it DOESN'T have a delay function, as scanner users are used to.
There should be _TWO_ different delays, after which scanning will resume.

In other scanners, scanning will resume almost immediately after the
carrier drops, unless the delay function is set. If the delay function
is set, then scanning will resume a few seconds after the carrier drops.
In this way, you can program simplex frequencies and repeaters with
very short hang times with the delay, and repeaters with long hang times
without the extra delay. This is a much nicer scheme that the R1 seems
to provide (after my quick scan of the R1 manual).

Well, I can't let this discussion of electromagnetic pulses go by

without mentioning the nice bit of accuracy in the movie "Testament."
When nuclear bombs destroy the San Francisco area, EMP fries the
transistorized equipment of the local ham (your basic grandfatherly
type) in the small Sierra foothills town where the movie is set.
BUT!....his old tube-based gear survives, and he uses it to maintain
contact with the outside world as long as possible.

Uh-oh, now I've probably started a war about tubes-vs.-transistors
to replace the current CW-vs.-SSB debate. :-)

By the way, it's a damn fine movie. Depressing, but excellently done.
And a prize goes to the first person who can tell me how to get in
touch with my one-time coworker Shawn Murphy, who did the audio for it.
He also mixed the "Batman" soundtrack (for the album release).

Incidentally, I've tried matching up the callsigns mentioned in the
film with the names of people mentioned in the credits (especially
engineering types), but haven't found any correlations. However, I've
never gotten the thing on tape and thus have had to read the credits
quickly as they went by, so I may have missed someone. Anyone know how
those particular callsigns were chosen for use in the film?

Patty

You can build any kind of transmitter you want. Operating it into an antenna is a different matter. :-)

> Park and restricted it to members only.

If all I had to do to become a member was show that I know how to act within the park so as not to mess it up for other park users and neighbors of the park, it wouldn't bother me a bit. Judging from some of the behavior I have observed in national parks, I'd even say it's not a bad idea!

With all the scanner mods floating around, does anyone have any modes for the
Radio Shack Pro-2021 scanner? It seems like a nice enough box. Opon opening
it up, it seems that the PC board is not fully populated. Maybe it is a
'generic' PC board which may be related to another brand of scanner?

I have a cellular phone installed in my car with a roof-top mounted
antenna. When the unit is transmitting, and when I turn the steering
wheel back & forth, it produces static in the receiver.

The unit is crystal (no pun) clear when I put it in the diagnostic mode and disable the xmitter.

I tracked the problem down to the steering column which has a contact for the horn switch. This metal rod makes contact with a metal "wiper" that allows the steering wheel to turn while still making contact. (Sort of like a volume-control pot with the wiper always providing low-resistance.)

When the metal rod runs across the steering wheel contact, it produces static. The radio is wired directly to the battery.

Suggestions ?

{ I hope I won't be branded a "Yuppie" for having a car-fone ;-) }

Steve

I disagree. The rules prohibit the hiding of information - they do not ban the use of cryptography purely for authentication purposes.

For example, you might issue a confirmation consisting of a QSO number, callsign, time and date, in both plaintext and ciphertext. Only the issuer could have generated the ciphertext that corresponds to the known plaintext, but since the plaintext is already sent over the air nothing is hidden. A public key scheme would be much better here, since it would eliminate ANY possibility of hiding information (anyone could verify an authenticator, even though only the originator could have generated it).

Of course, to make any such scheme cryptographically secure it would have to consist of at least 64 bits of both plaintext and ciphertext. And given the speed and accuracy of most CW QSOs I doubt that many of the contest ops would go for such a scheme...

If it's a video relay, it is (probably) FM. (It's in the fine print somewhere, but I couldn't find it). The 902-928 Mhz band also allows low power convential transmitters under part 15. Only the spread spectrum systems get 1 watt.

]installers for the receivers. Most of the receivers are installed at
]hotels and bars. Many locations simply can't be served. Microwave
^^^^^^^^^^^^^^^
This is not true.

You whole point seems to be aimed at how to get MORE tv to the
consumers using existing technology. I think that, no matter
how commercially attractive, it's about as forward looking
as any other waste of natural resources. Today there
are many ways to get information and entertainment into the
home. VHF/UHF Broadcast TV is one of the most wasteful and is a dinosaur.
It can be replaced with:
  Cable (including fiber systems)
  MDS
  Satellite DBS
  C-Band Satellite DBS (ie TVRO)

Right now I get 5 VHF TV channels, and a few UHF. I get 120 channels
by TVRO. A few of those local TV channels are enough to provide local
news and advertising. Why do we need a bunch of others showing old
movies and syndicated re-runs, when they are tying up such an extremely
valuable natural resource (18-42 MHz PER UHF CHANNEL!)?

I've heen told it's safer to climb a Rohn-25 with the point, rather than the face, of the tower toward your body. This seems to give you more shoe contact (but you tend to waddle a bit since your feet are angled to the side) and best of all gives you a chance at grabbing at the tower should you lose your grip. In other words, don't treat the tower face as a ladder; straddle the tower while climbing or descending.

I have a Regency HX1500 hand held scanner. I'm wondering if anyone
has any mods (or a source of mods) for it. I'm interested in "filling
in the gap" between 174 and 406 Mhz.
If anyone has anything, either post it here or send direct to

novotny@nosc.mil

Thanks.

Somebody help Bill out - 73 can't be that hard to find - can it? A ham store should suffice but I can't help not being in Seattle.

|>   REQUIREMENT FOR A KNOWLEGE OF CW BELOW 30MHZ.

Yup, why just last week a nuclear weapon exploded near my house and the resulting EMP destroyed all of the SSB and RTTY circuits in my IC-751A. But the CW circuits kept on workin' just fine. Boy, was I glad I had learned the code so I could keep on chewin' the fat with the boys on 80...

Those who argue that CW is essential when "the chips are down" seem to consider only the transmitter. How about the receiver, which is much more susceptible to EMP? Remember, if you can't hear 'em, you can't work 'em. If simplicity of overall system design is what you're after, then AM is the mode to use since it can be received by crystal sets.

Can anybody help with a manual, drawing or any other material that describes
how to assemble a VS81W antenna made by Hidaka Denki Works in Japan.
I bought a VS81W sealed in its original box from a dealer but there were
no reads in the box and since I had opened the box the dealer did not
take the thing back. !@!!*^^!
I called Hidaka-Denki in Japan but these people did not respond to call
or FAX. Summary: Hidaka people are polite but their service stinks!

In case you can help - please send a note.

EMP as a justification for CW testing? Dont make me giggle!
Remember; a decent EMP will take out *all* your semiconductor devices; it will
also make quite a mess of even some electromechanical systems (do any telcos
still have STROWGER exchanges? *they* just *might* survive!).
If you do get EMP'ed then you will most likely lose your AC supply.
How many hams could put a station on the air using no semiconductor devices,
and powered from auto batteries? Does anyone remember vibrator or dynamotor
power packs for generating the B+ rail in the good old tube days?
Has anyone still *got* any of this gear? Does it work?   Mine does.
And surely AM is the best in an emergency because you can receive it on a rusty
bolt.

CW testing is as irrelevant to EMP preparedness as it is to ham radio.
Why not bring back the requirement that all autos must be preceeded by a man
with a little red flag. Anyone remember Semaphore?
Come on America! Follow the LEAD of much of the rest of the World and introduce
a code-free licence. Sign a reciprocal arrangement with CEPT so you guys
can come over here & work the bands without the hassle of applying for
reciprocal licenses.

You could use a saeft (BKSP is dead) safety decender used in mountain
climbing (or more often, rescue) which is a gaget that has 5/8ths line
run through it, and when release (it has a lever on the side), it locks.

I think they can also be had with a rachet in one dierection and again,
locks up when released.

...and then, you could also climb half way and use a bunji cord...

Why not look to mountain climbing equipment? Try a local club for
ideas or write to

L. L. Bean Co.
Freeport, ME 04036

and ask if they have a catalog of such equipment.

I occasionally find myself doing antenna work atop guyed towers such as Rohn 25 or 45. While I feel quite safe once I am buckled in with a safefy belt, I keep thinking that there must be some simple devices that could make the climb up or down safer. Does anyone know of a commercial device that can prevent a person from falling off a tower during climbing? I'm thinking of something along the lines of a strong rope or wire that runs the length of the tower, which some kind of attachment to a safety belt. The attachement to the rope or wire would have to allow you to climb up freely, and maybe allow you to descend slowly, but grab if you tried to descend too rapidly.

>$10 per receiver.

Actually it is 12Mhz of empty space, second adjacent is the rule. Each
broadcast channel is 6Mhz. Second adjacent means two channels or 12Mhz.
Designing a fliter system that is very flat with 0.2 degree phase linearity
over a 6 Mhz bandwidth while having high rejection immediately adjacent
is neither simple nor cheap. Phase linearity is the key here as our
NTSC system depends on the color subcarrier phase to convey hue imformation
while depending on amplitude variation to convey saturation information
AND depends on both frequency and amplitude variation to convey luminance
information. NTSC is not technically the best way to transmit television,
but there is $50 BILLION dollars worth of equipment out there that depends
on it. There's no realistic hope of changing the system now.

>
>UHF stations should be able to operate much closer and even ADJACENT.
>

No, the same limitations apply to them.

>2 to 4 Ghz. FM radio broadcasting still tends to be mobile enough
>that it should not have to move up there. The appropriate usage for
>spectrum in the 30-3000 Mhz range is mostly mobile.

This sounds reasonable at first glance, however there are millions
of "portable" televisions in operation in this country. In addition,
if you think we have ghosting problems now, you have no idea how
much worse multipath becomes as you go up in frequency.

>
>Just think of what land mobile could do with 42 Mhz of VHF high band

>used to expand FM broadcasting, and 54-72 could have many other uses.
>
>We just need to find a place to put broadcast TV way up there.
>I would certainly urge that HDTV *NOT* be allowed below 2 Ghz.

Ah the mythical HDTV! Don't hold your breath waiting for BROADCAST
HDTV. The economics just aren't there. My company participated in

the HDTV tests done for the FCC. We estimate it will cost between
$20 million and $50 million to convert a television station to
transmit HDTV. With an installed base of $50 billion in NTSC equipment
and NO original HDTV programming (except some old "I Love Lucy" reruns
that were shot on 35mm film--REAL HDTV) available to fill the hours, no
sane broadcaster is going to attempt the switch. You may see some
experimental HDTV on cable where the origination costs are lower,
but, until a large enough audience is equipped to receive HDTV, no
one is going to broadcast it on a regular basis.

?code and upgrade within a year.

I'll second that wholeheartedly. I took the Technician test while my
Novice license was still pending. The examiner suggested that as long
as I was there, I might as well take the test for General -- which I
passed, and then Advanced -- which I passed as well, and then Extra.
I got everything but the 20 wpm code, and made my first QSO as
KB9DLU/AA. Actually, I was operating a club station, and was therefore
W9YH/KB9DLU/AA... which is quite a handful to beat out in CW 8-).
The guy I contacted on 14.056 was quite surprised to hear that it was
my first QSO. 8-)

Hi...

Sorry for posting, but I've archived all my back messages prior to going on vacation. When I came back not only was I not getting Info-Hams, nobody at our site is!

So if anybody sees this, please let me know: is the SIMTEL20 distribution still alive? Then I can tell our net-server guru to begin looking on his end!

Thanks, & 73...

I have scanned the specifications of the IC-R100 (from a brochure) and the IC-R1 from my manual (which happens to be in English :-))

R1 Specifications

o Frequency coverage:

VERSION	FREQUENCY COVERAGE
U.S.A., Australia, Asia	100 kHz - 1300 MHz
Germany	13.95 - 14.5 MHz, 28 - 29 MHz, 144 - 146 MHz, 430 - 440 MHz, 1240 - 1300 MHz
France	100 kHz - 87.5 MHz, 108 - 1300 MHz

Specifications guaranteed
2 - 905 MHz.

o Selectable tuning
step : 0.5, 5,8,9, 10, 12.5, 15, 20, 25,30 or
50 kHz

o Number of memory
channels : 100

o Mode : FM, AM, Wide FM (WFM)

o Antenna impedance: 50 ohms (unbalanced)

o Power supply
requirement : 7.2 V DC (internal battery)
Optional BP-81 - BP-85 or BP-90
External DC power 6 - 16 V DC

o Current drain : Max. audio output Less than 300 mA
Power saved Average 15 mA
Duty cyc le Receive: Standby = 1: 16

o Usable temperature
range : -10C - +60C; +14F - +140F

o Dimensions : 49 (W) x 102.5 (H) x 35 (D) mm
1.9 (W) x 4.0 (H) x 1.4 (D) in
(projections not included)

o Weight : 280 g; 9.9 oz

o Receive system : AM, FM Triple-conversion
superheterodyne
WFM Double-conversion
superheterodyne

o Intermediate
frequencies : 1st 266.7000 - 266.7095 MHz
2nd 10.7000 MHz
3rd 455 kHz (FM/AM only)

o Sensitivity : AM (for 10 dB SIN)
1.6 uV (2 - 24.9995 MHz)
0.79 uV (25 - 905 MHz)
FM (for 12 dB SINAD)
0.79 uV (2 - 24.9995 MHz)
0.4 uV (25 - 905 MHz)

	WFM	(for 12 dB SINAD) 6.3 uV (2 - 24.9995 MHz) 3.16 uV (25 - 905 MHz)
o Squelch sensitivity :	AM	1.26 uV (2 - 24.9995 MHz) 0.63 uV (25 - 905 MHz)
	FM	0.63 uV (2 - 24.9995 MHz) 0.32 uV (25 - 905 MHz)
o Selectivity :	AM	More than 15 kHz/-6 dB
	FM	More than 15 kHz/-6 dB
	WFM	More than 150 kHz/6 dB

o Audio output power : 150 mW at 10% distortion with an 8 ohm load

o Audio output impedance : 8 ohms

All stated specifications are subject to change without notice or obligation.

R100 Specifications
===================

o Frequency coverage:

Version	Frequency Coverage
U.S.A.. Europe Australia	100 kHz-1856 MHz*
Germany	13.95 - 14.5 MHz, 28 - 29.7 MHz. 144 - 146 MHz. 430 - 440 MHz, 1240 -1300 MHz
France	0.1 - 87.5 MHz, 108.5 - 1856 MHz*

*Specifications guaranteed 500 kHz - 1800 MHz

o Mode : AM, FM, wide FM
o Power supply requirement : 13.8 V DC + 15% (negative ground)
o Antenna impedance : 50 ohms (unbalanced)

o Current drain (at 13.8V DC) : Less than 1.1 A

o Usable temperature range : -10C - +60C; +14F - +140F

o Frequency stability : +/- 3.5 ppm (at 1800 MHz, -10C - +50C; +14F - +122F)

o Number of memory channels : Memory channels 100

Priority channels
Scan edge channels 20
(for 10 scan ranges)

o Tuning step increments : 100 - 521.5 kHz and 1.630 - 904.9995 MHz
1, 5, 8, 10, 12.5. 20 or 25 kHz
522 - 1629.5 kHz
1, 5, 8, 9, 10, 12.5, 20 or 25 kHz
905 - 1856 MHz
12.5, 20 or 25 kHz

o Dimensions : 1 50(W) x 50(H) x 181 (D) mm
5.9(W) x 2.0(H) x 7.1(D) in
(projections not included)

oWeight : 1.4kg; 3.1 Ib

o Sensitivity : Maximum sensitivity values are indicated in each range below. Preamp is ON in 50.000 -904.9995 MHz.

Frequency Range	AM (1)	FM (2)	Wide FM (2)
500 kHz - 1.6295 MHz	3.2 uV	---	---
1.63 - 49.9995 MHz	1.6 uV	0.56 uV	---
50 - 904.9995 MHz	0.56 uV	0.2 uV	0.63 uV
905 - 1380.4875 MHz	1.0 uV	0.32 uV	0.79uV
1380.5 - 1800 MHz	1.4 uV	0.45 uV	1.1 uV

(1) For lOdB S/N (2) For 12dB SINAD
--- : Not specilied.

o Selectivity : AM More than 6 kHz/-6 dB
FM More than 15 kHz/-6 dB
Wide FM More than 180 kHz/-3 dB

o Audio output power : More than 2.5W at 10% distortion with an 8 ohm load

o Audio output impedance : 4-8 ohms

All stated specifications are subject to change without notice or obligation.

A couple of notes from me

In the UK the R1 costs 399 GBP and the R100 499 GBP.

The R1 also has 20 scan edge channels and a priority channel; the priority mode can use either a single channel or a a range of channels choosing the next channel every time it checks.

The R1's sound is very good considering how small the speaker is. In a

quiet room with the volume turned up, it is quite acceptable listening
from the other side of the room.

The R1 seems to receive very well over 905 MHz but is the only radio I
own that covers, but cannot pick up, BBC Radio 4 on longwave (198KHz)!
I assume that this is because I have only used the supplied VHF/UHF
antenna; however it can pick up a station nearby :-(

I hope that this is of some use

Kevin

-I just purchased a LORAN-C for my 32' sloop. It also has a Yaesu
-FT107M ham radio HF tranceiver aboard, connected to a heli vertical.
-
-I'm a bit worried about how the LORAN equipment will handle 100W of
-RF being radiated 6' from its antenna/coupler... currently I
-disconnect the LORAN whenever I use the ham rig; am I being
-excessively paranoid?
---
-Pontus Hedman  rph@sq.com {uunet|utzoo}!sq!rph

My LORAN-C (an mi-3000 locator model) didn't take too kindly to me transmitting
~50W of ATV (429.25 MHz) about 2 feet from it's antenna.  It got very lost,
but sustained no damage.  I'm thinking of sticking a high-slope low pass filter
in line with the antenna, with a cutoff of about 1 MHz, just to see if it'll
help.  My 10 and 2m rigs (25 and 5 W, respectively) seem to have no effect.
The LORAN, however, messes with my 10m rig.  Lots of cpu and switching noise.
Your mileage may vary.

Interesting idea.  But the RST/RS is not a good base for the input...
All DX contacts are 59 !! Especially in contests.  The band/time/freq
and call would be a much better idea.  However, during the heat of
a contest where some of the serious contesters are concerned about rates,
the time to generate the unique number may not be acceptable.  Even
some of the DXpeditions operate in a contest mode.   Just some random
```

thoughts. But I like the idea, since it is sometimes quite hard to get
a card to a DX station or get the card back.

OK, so CW is "relevant" if you're going to operate in the "weak signal
portion of the band." Now please explain why it is "relevant" to GETTING
A LICENSE in the first place. After all, I'm currently LICENSED to use RTTY,
but I didn't have to pass a typing test.....

From the NPRM, (The FCC quoting the ARRL).

> The ARRL states that its suggested name "Communicator", although
> "not exaclty reflective of the type of license envisioned in the
> proposal ... is, however, the most descriptive among the alternatives
> considered".

Even the FCC knows the name is misleading.

)It would go a long way toward building a strong HAM fraternity.

Fraternity, I don't want to join some stinking fraternity. All
I want to do is sit in my basement and build things that go Beep,
not join some lodge with its strange rituals and hazing. But
the regulations say that if I want to build a transmitter bigger
than 1 Watt, I either have to have a serious amount of money or
be a ham.

How would you like it if the Elks lodge owned Yosemite National
Park and restricted it to members only.

Try:
     "The DSP Project Update," Clark, T. and McGwier, R., Proceedings
     of the AMSAT-NA Sixth Space Symposium and Annual Meeting, 1988.

A quote therefrom:
     "...the early experiments done by the authors over a 150 mile
     path on 70 cm with satellite arrays were astounding to say the
     least.  The power could not be turned low enough at N4HY for
     W3IWI to prevent detection..."

]>Err... first of all, probably we are spreading at less than 1000:1 -
]>certainly if we are on 2 meters. Second, if the SS system is radiating
]>100W ERP (not unreasonable power), we are looking at +50dBm. So,
]>take your 100 dB of isolation, and you are looking at -50dBm of
]>noise into your narrow receiver. That's a LOT of power! As I was
]>pointing out, you need a large amount of isolation.
]
]Wait! Of that +50dbm of ERP, how much is out-of-band? My impression
]of SS is that we are required to keep intentional radiation inside
]the band. Therefore the only power that can pass into the out-of-
]band narrow receiver is that small percentage of the total transmit
]power contained in spurious responses that happen to be within the
]passband of the narrow (20khz) receiver. Therefore simply subtracting
]and getting -50dbm doesn't seem to be valid.
True... subtract another 30 dB for spreading. Still at -80 dBm - still
lots of noise. As far as keeping radiation in-band... that's my whole
point: that it is hard to do without expensive filters.
]
]Also SS on 2m? I guess I need to reread the rules, I thought SS
]had to be 420Mhz and above.
Oh well... I was talking technical. Forgot the rules. However,
same applies to 440.
]
]>]desense or intermod to the narrowband equipment. We did wind up
]>]adding a cavity to the output of the modem, but that was because
]>]the narrow band equipment was desensing our modem enough we couldn't
]>]copy a weak signal from one of our other modem links.
]>]
]>Specifically, 70kHz is narrow enough to allow running it through a
]>cavity, which you did. That adds a lot of isolation. In fact,
]>running 56 kB through 70 kHz is nowhere close to "spread spectrum" -
]>you are running slightly over one bit per Hz. I would expect
]>real spread spectrum to be way down from that.
]
]Reread what I said. We added a cavity later because the narrowband
]equipment was bothering us; not the other way round. I agree that
]real wide spread spectrum should have even better characteristics.
Yes, but you were trying to give an example of a case where SS
went through a cavity, and I was just pointing out that the
example was inappropriate.

I am interested in getting hold of a tnc and was wondering what the benefits or otherwise were of buying one that was packet only, or going for a multi-mode unit with rtty,morse,fax etc. Is it better to have all the modes you

may want tied up in one box, or have seperate boxes. How much use do you really get from some of these other modes after you've looked at several weather pictures from mongolia etc ... Packet is what I want now, but do these multi-mode units give upgrade options for external modems etc ? Would anyone even like to go so far as to suggest advantages and disadvantages of the major brands ?? (Ive been looking at the MFJ)
Also - is there any software available for the macintosh to run tcp/ip over packet. Is is public domain, FTP'able? or where can you buy it etc ...

Any help would be appreciated, mailed rather than posted please.

-
No problem whatsoever. In May, with a form 610 and a copy of my trusty Novice ticket, I went to an exam session given by the Brazos Valley ARC and wrote Elements 3A and 3B. They sent my 610 to the FCC and issued me credit for 3B. I did not even attempt Element 1B [13wpm] so I still have to pass that element to upgrade to General. However, I _only_ need the code [for another 9 months or so.] To reiterate, no problem whatsoever - atleast here in Houston.

Note, however, that I did have to pass Element 3A before I could write the exam for Element 3B, but that has nothing to do with Morse

code. I would suggest you politely ask the VEs in your area if they
perhaps misunderstood the FCC rules regarding this.

I've power-charged NiCads by hooking them up to a garden-variety power
supply through a low-value resistor (e.g. 1 ohm). By using a voltmeter
across the resistor, you know the current. Adjust the resistor until
you get 80-100 mA. Note that P=I^2R, so don't blow up your resistor.

Note that 80-100 ma for 16 hrs is about 1.3 mA-hr, so if you are impatient,
you could presumably charge it at 1.3 amps for 1 hour instead. I usually
am, so I charge to 80% capacity, then put it on trickle to top it off.

Oops. :-) Guess you're stuck now where I am.

> BTW, you were hitting the .310 machine real nice from Crystal Peak...

Uh oh, I'm getting [in]famous. Yeah, I was surprised that particular repeater worked better for me than all the others in the Colorado Connection:

```
Distances (miles) from Crystal Peak (13852)
    8    147.015+ Breckenridge (Bald Mountain, 13684')
     APPROX
   11    145.445- Leadville/Fairplay (south of Mosquito Pass, 13240'+)
** 49    145.310- Denver/Boulder (NE Thorodin Mtn = Starr Peak, 10511')
   50    145.400- Denver (Mount Lindo, 7814')           APPROX
   69    147.285+ Salida (Methodist Mountain, 11655')
   80    146.910- Colorado Springs (Woodmen/Union jct, 6460')
     APPROX
   81    145.355- Parker (junction at 5850' + 9 miles east)
     APPROX
   85    448.500- Colorado Springs                 APPROX
   98    147.285+ Rifle (West Anvil Point, 8680'+)      APPROX
  135    449.300- Cheyenne, Wyoming                APPROX
  146    146.730- Walsenburg (North Rattlesnake Butte, 6439')
```

I could hear a lot of the repeaters but only work a couple of them.

> (why isn't it called peak 11?).

I don't know why they named ten peaks as Peak 1 through Peak 10, north to south (allowing that Tenmile Peak is Peak 2), and then started calling them Crystal, Pacific, and Fletcher.

Anyway, Peak 10 was a wonderful place to watch the sunrise (and play radio) last Saturday. Crystal was on the way to Pacific...

OK, let's for a moment discard the remote/depressed areas where local hams probably don't have computers and probably aren't too interested in having someone issue a key so they can run their own rigs. Let's just consider this for places where hams DO have computers and DO want to "play the game" (which, naturally would include all the DXpeditions, since that's what they're out there for.) We don't have to replace ALL QSL cards, maybe we could just replace SOME of them.

|> [...]   All

|> 73's --- VE5ZX (op syl) soon to be G0/VE5ZX
|>

An interesting idea that deserves attention, I'd be concerned about the effect on QSO rates and on the secondary effect of funds available to DXpeditions. (Lot's of people put in a little "something extra" in their QSL requests, but if you're no longer going to write off for a QSL, would they still be motivated to send a contribution? Another concern is motivation. DXers want those cards, but do the DXees ;-) have an equal motivation to get them out? Why should they invest in "instant QSL's"? I don't know the answer to that one.

My guess is that if you'd like to develop this idea, DXpeditions are the first place to look. They carry technology with them, so there's less of a problem with availability of machines to do the calculations, and since so many people want cards from them, there is the maximum benefit. If the DXCC desk would go for it, other awards programs might back it too. If a major DXpedition were to use the idea, probably many of the not-so-exotic stations would follow suite. Then we could exchange "DXCC numbers" the way they exchange "10-10 numbers" on 10 Meters.

There'd still be a need for cards though... I know I'd rather have the cards than the awards. As for the exotic locations -- they'll probably always require cards. (And of course, now there's something else for old farts to wax nostalgic about,
"When *I* started in radio, we sent confirmations in the mail."
"Isn't that kind of stupid, given that you've got a radio?"
"No, we were better hams back then because of it. You kids today...."

>>>==>PStJTT
Patrick St. Joseph Teahan Taber

My employer doesn't care what I think. I, in turn, don't care what you think. You probably don't care what my empolyer thinks. Thus is life a circle.

> on the input frequency, using the repeater's PL, that is my right!

To which tad@ssc.UUCP (Tad Cook) replied:
- Ohhhhhh......I don't think so! This has been tried during some of the
- "repeater wars" in Southern California, and believe me, the simplex
- operators were cited!

Huh? John Moore said "using the repeater's PL" which implies to me that he was using the repeater. No? If a properly licensed amateur radio operator USES a closed repeater, what FCC regulation is she/he violating? If this is an FCC violation, something is very wrong.

But montague@npdiss1.StPaul.NCR.COM (John Montague) claims:
-
- Such an action, if it can be shown that you know that you are using the
- private repeater's PL, would be willfull and malicious interference; an
- action prohibited by FCC regulations.
-

? ? ? ! ! !   Please explain how using a repeater can be considered willfull and malicious interference. If someone else was talking on the repeater and I stomped on them, then that would be a violation. However, if like most private repeaters, it is not being used, then I fail to see who I am causing interference to. Maybe I'm a fritter-head, but I don't understand. Could somebody please explain this? Please cite the applicable FCC regulation too. By number. TNX

Hello.

I would like a copy of the article in the October 1987 issue of "73" magazine detailing the construction of a Polarplexer for use on 10GHz.

Any help would be appreciated.

Thanks...John.

Nothing is free. The tradeoff in this case is a couple of hundred dollars
worth of signal processing parts or three months of your time memorizing
Morse. And the signal processing stuff will still out perform the trained
ear in the end.

Gary

I need help from any of the RFI gurus on the net. I am getting into my TV and VCR big-time. Any suggestions are welcome. Please save my marraige - my wife likes TV, and I like ham radio. :-o

Channel 2 and Channel 6 (2nd and 3rd of 28 Mhz, 4th/6th of 14 MHz) are affected (crosshatching), even at 100 watts. The picture is adversely affected with or without the VCR connected. I've installed a low-pass at the xmtr, and a hi-pass at the TV. The TV stations are 50-60 miles away, so I may be fighting the fringe.

The antenna is a ground mounted vertical with a reasonable (24 radial) ground plane. The TV/VCR is located at the other end of the house, about 40' away. The TV antenna is also about 40' away and 30' up, and certainly in the field. Transmitting with 500 watts is right out - the picture is severely affected. If I transmit into a dummy load, the TV is clean, even at 500 watts, so I'm not getting in via 120 VAC. I think this also means the trasmitter is reasonably grounded.

I have heard about replacing the TV antenna with a 75 ohm resistor - this will determine if the TV is picking up TVI via the antenna or via poor shielding at the set. As I recall, I tried this (the attic is a jungle of fiberglass), and got no interference.

The question now becomes one of eliminating the TV antenna as the culprit - corroded metal diodes and all that. It is very dry here, and the antenna has been in the attic for 10 years, so corrosion is unlikely. How do I tell ? And if it isn't the TV antenna, how do I find the source of the harmonics ? The set has some funky rabbit ears - I'll see what they do when I finish typing this in.

Yours for better neighborhood relationships,

Perry Scott

Just a fan note for TS-940S owners. Several 940 owners in the local area have had their original fans become extremely noisy after about 6 months of use on the radio. Probably because of shot bearings in the motor. We replaced the fan with a real EG&G Rotron unit, that is just super quiet and does a fine job. However this unit doesn't fit under the heatsink and must be mounted externally to the rear of the heatsink.

By the way there are two fans on a 940. The one attached to the power supply heatsink runs regularly, a few minutes on then a few minutes off, etc. There is another fan attached to the RF deck heat sink. This fan only comes on after a period of extended transmitting, such as during contests.

You'd think that for such a nice rig, Kenwood could put something other than a cheap $2 fan on the power supply.

Take care and 73,
Al Rovner, WA2TMP

That sounds more like it! Is there any comparison in the article to how the signal sounded by ear?

This particular article didn't appear in the previously posted extraction from someones online database. The title gives no clue that the DSP application has anything to do with signal detection. What we really need here is better titles. Might as well name every article in QST as "Radio Stuff" :-)

>

Not true. The AEA DSP-1232 and DSP-2232 first production unit was delivered to my house last week. Notice I said PRODUCTION, that has nothing to do with the laboratory. While it is not available on the market yet, that will happen this fall. One of the `pre-conditions' Mike Lamb (prexy AEA) put on this was that I work out a weak signal mode for EME without $10000 worth of antenna. On terra firma paths, this is even easier as the coherence time is much longer (usually) than on EME paths. TAPR and AMSAT have their first Beta units to be delivered to software writers within the month. Tom Clark (W3IWI) and I STARTED the DSP in amateur radio hoopla in TAPR and AMSAT by DOING EME with Oscar class stations and DSP techniques based on software I wrote in 1986. My papers in the AMSAT and ARRL networking conferences haven't contained details of this work (intended for popular audiences). This will be the source of a great deal of detail in publication over the next year as I begin to work very hard to popularize and sell DSP as the solution to many of ham radio comm problems. It will also make specialty modes more affordable and encourage experimentation on weak signal modes that were not possible before now. Tom and I are working now on new modems for HF multipath dominated links, primarily as an intellectual exercise at this time, but leading to real working systems. All work at this time is on the Motorola DSP56001 and it is a very popular chip (and STILL available in cheap SLAMPAK regardless of rumors to the contrary). Ray Pettis recently published a scheme in QEX for using this chip and quite good clocks to get matched filters to bring signals out of the noise. He is not trying for the exciting 1 bit per second, otherwise inaudible links yet, but he COULD in short order. I emphasize, this is not the lab, this is people doing it on the air and will be available soon from dealers all over the world in working boxes.

There is not a single doubt in my mind that << so long as good clocks are available to your computer>>, DSP techniques will outperform CW+brain. In an emergency, etc., where you do not have access to extremely good clocks, CW may be the answer, but I will leave this for a future submission after I have

returned to working on this particular problem as I am working on other
things at present.

>   - Brian

Brian:

While I TOTALLY agree with the sentiment, you must recall that LUSAT
(LO-19) has a CW beacon. Since the world (and the Argentinians) grew
tired of it, it stayed on the air about four months and was switched off.
THERE is cause for a small snicker. I suspect that pride, etc. will cause
it to be turned on occasionally. The only comments I have personally
received (by people who know my stance) is that they were unhappy it was
on since I had to reduce the power output of the PSK beacon to compensate
for the power used by the CW beacon ;-).

Thanks to all for your comments, Repeater jamming etc all seems very tame
over here in the UK compared with state-side.

>Repeaters are not operated by private individuals here; they are run and
>maintained by local repeater groups (who hold the license for repeater
>operation). We dont have that many repeaters either (there are only 7 channel

However it may not be quite as much a free for all as it appears. Here in
Central Scotland the repeater group manages 3-4 repeaters on 2 metres.
The publish a membership list and actively discourage others from using
the repeaters except for visiting amateurs to the area. The idea being
that only those who contribute to the running of the repeaters should
benefit from them. Also the repeater group is under funded, so it wants the
free loaders to cough up some bread.

James Gentles GM4WZP (fully paid up member of Central Scotland FM Group)

My work is with W3IWI, KB2CST, KA2MOV, WA7GXD, AEA, ARINC, and DRSI.

All this stuff will explode from AEA, TAPR-AMSAT, etc. in the next few months
and the adds WILL be in QST. Articles will be in several places but this
will follow sometime after the boxes/cards are out due to the amount of time
needed to do the actual work.

Oh yes, I forgot to comment on this statement. I agree that we were behind as a group in applying DSP technology to ham radio problems. HOWEVER, the multimode, all purpose, do it all DSP box is truly UNIQUE in its availability (or will be shortly) with open programming models, etc. I cannot think of another instance where this has happened and should have many groups in industry etc. wondering how those `damn hams' did it again. Some of the stuff we will be doing with DSP is not done ANYWHERE else and is too risky to be tried commercially. So long as ham radio continues to be a place where this kind of work can go on, there is a place for ham radio occupying the valuable spectrum it does. We are about to step to the forefront again in a couple of areas with comm systems based on DSP, etc. that don't exist elsewhere (commercially available, forget spooks, they don't count ;-).

This ability to do experimentation that is not `allowed' at work is the reason given over and over again by the KA9Q's, NK6K's, W3IWI's, WA7GXD's myself, and on and on (including WB6CYT if we ever get to sit down over that beer, I would be willing to bet) for their continued interest in ham radio.

How about a campaign
to suggest how all "phone nets" can get on "precisely" the same frequency, independent of an individual's "taste" in tuning in a signal.

My suggestions are based on the assumption that the large majority of transceivers are digital/synthesized, read only to 0.1 Khz on the main display, and have the option of tuning in exactly 1 Khz steps where it necessarily stops "precisely" on a full digit. My Icom 751 does this and I feel pretty sure that other similar equipment does the same.

1. Have all nets agree to use a "full" digit (no 0.1 Khz fractions).
2. Have all participants leave their main tuning in the "1 Khz-step" mode only, to step to the desired digit.
3. Henceforth, DO NOT TOUCH the main dial....use only RIT (Receive Incremental Tuning, or whatever descriptive term is used).
   Thus each person can set his RIT to suit his own personal taste with only one setting and everyone will automatically suit "his ear"!

Of course all the above depends on the transceiver being precisely calibrated to WWV, and I suggest the following:

1. Using the same 1 Khz-step mode only, set WWV upper-sideband on VFO A, and WWV lower-sideband on VFO B so that you can quickly toggle between them. BE SURE to have your RIT off, or cleared to zero!
   (Alternately, for quick, easy check, I set WWV 5Mhz in Memory-channel 1 & 2, 10 Mhz in 5 & 6, 15 Mhz in 9 & 10, using the gaps between sets so as not to accidentally toggle WWV on two different frequencies, since the transceivers are not absolutely perfect)
2. Now wait for WWV to send their "musical tone" (not preset during some intervals), and simply "tweak" your calibrator until your ear tells you that the two musical tones match, as you toggle quickly between upper and lower sideband. I feel certain that almost everyone has a good enough "ear" to recognize when the tones match!

   By the way, if you thought you were good at tuning in speech perfectly..try first "tweaking" your calibrator until you think the voice sounds natural (do this before the tone test)...then use the comparative-tone test and see how many Hz you missed.

In article <1124@ke4zv.UUCP> gary@ke4zv.UUCP (Gary Coffman) writes:
]Actually it is 12Mhz of empty space, second adjacent is the rule. Each
]broadcast channel is 6Mhz. Second adjacent means two channels or 12Mhz.

This is true for VHF, but not for UHF. UHF has at least 3 empty channels between each station. Here in Phoenix (population > 2 million), it has 6 empty channels each. In addition, harmonic and intermod relationships cause additional channels to be set aside. This IS a big waste.

]Designing a fliter system that is very flat with 0.2 degree phase linearity
]over a 6 Mhz bandwidth while having high rejection immediately adjacent
]is neither simple nor cheap. Phase linearity is the key here as our
But it really isn't that hard to do for rejection with ONE guard channel on each side, which would greatly reduce the waste of UHF spectrum.

I should also point out that an experimental license was issued to at least one company that transmits data on ADJACENT UHF channels. Their trick: they only transmit during the sync pulses from the adjacent station, at which time the TV is tens of dB less sensitive to interference. A neat (and patented) trick, IMHO.

]>But what is really sad is that VHF and UHF TV is a primarily FIXED
]>point-to-multipoint service, which is more suitable to spectrum above
]>2 to 4 Ghz. FM radio broadcasting still tends to be mobile enough
]>that it should not have to move up there. The appropriate usage for
]>spectrum in the 30-3000 Mhz range is mostly mobile.
]
]This sounds reasonable at first glance, however there are millions
]of "portable" televisions in operation in this country. In addition,
]if you think we have ghosting problems now, you have no idea how
]much worse multipath becomes as you go up in frequency.

Pay TV is in fact transmitted on microwave in many areas of the US. I have heard no reports of multipath (since they use a roof mounted dish or loop yagi). It DOES work. I would hope that any broadcast HDTV use microwave spectrum ONLY.

Re: The rest of the world.....

You know, some things don't change much.

In the newest issue of OFF-ROAD magazine they have an article about
CBs, CB antennas and stuff. They have some cute things on antenna testing
but what strikes me as funny is:
(1) They show a picture of a fellow's truck and specifically mention his 150 watt linear. (Guess I'll have to copy the article and send it to Uncle....)
(2) They have a very nice sidebar describing a top-of-the-line Midland CB with SSB capability. They go on to mention how SSB is FM and how FM SSB is so powerful and quiet. :-)

When I was in college I had a friend, WB4DBB, who fixed radios for a
living. He had stories about CBers and their "joltmeters, omenmeters"
and the guy who was driving around with 50 gallons of saltwater in
containers in his trunk because he'd noticed he got bettter range
from the CB in his boat........

Now, back to your regular discussion of non-technical licensing :-)

Ron
NW0U

(I was interested in CB for awhile but I got over it with ham radio.)

I certainly agree that we need some means of "confirming" QSOs that would cost less money and effort (and frustration!).

The solution you describe in which encryption is involved is illegal in the United States -- no encryption on the amateur service. (Albeit the 'Q' signals seem a bit cryptic, they are internationally recognized.)

As the other responses point out, many of the DXpeditions/major contests have the computing power with them. Could the League or some other clearinghouse make disk copies of their logs? A fee (annual?) could be paid to the League/clearinghouse to supply you with your 'award status' -- which you could use in place of (or in conjunction with) QSLs when submitting for DXCC, WAZ, etc. Of course, if the League handled it, they could immediately see your DXCC status and mail you the appropriate certificate/endorsement!

Does anyone know what the purchase price of an IC-24 is in Tokyo (Akihabara)? Can one which is purchased in Japan be converted for use in the US? Can it be converted to wide coverage? If it breaks, will ICOM America fix it? Under warranty?

Can the IC-24 transmit out of band? Specifically I am interested in using it for Civil Air Patrol and Arizona National Guard.
[Please, no out of band flames. It is legal and legit for
both of these uses]

[my brother lives in Tokyo and hence can shop for me in Akihabara.
I got my TS-430 that way some years ago.]

As a licensed amateur radio operator who has successfully passed a five
word per minute morse code telegraphy exam in order to get my operator
license, I can tell you that the PK-232 can copy morse code off the air
much better than I can.

So tell me, did the code test do me any good?

Did it accomplish the purpose increasing my operator skill?

What it did accomplish was keeping me out of ham radio for 18 years.
And for most of that time I had subscriptions to 73 and HR magazines.

After reading the ARRL Technician Class license manual and looking at the test question supplement to be used for the question pool after July 1, 1990, I am completely confused.

===

After reading chapter 8, "Signals and Emmissions" I came across the following:

F1B - Telegraphy using frequency-shift keying without a modulating audio tone
      (FSK RTTY)

F2A - Telegraphy produced by then on-off keying of audio tone fed into an FM
      transmitter.

F2B - Telegraphy produced by modulating an FM transmitter with audio tones.
      (AFSK RTTY)

3AH-2-3.2

Page 10-44
What is the emission symbol for telegraphy by frequency shift keying without the use of a modulation tone ?

A) F1B   B) F2B   C) A1A   D) J3E

After 7/1/90
Page 10-62
What is the emission designation for telegraphy by frequency shift keying without the use of a modulation tone ?

A) RTTY   B) MCW   C) CW   D) Sideband phone

Answer is A.

-?) What is MCW ?? Is it modulated code wave ??? Why is F2B designated as MCW when F2B is AFSK RTTY ??

3AH-2-4.1

Page 10-44

What emission type results when an on/off keyed audio tone is applied to the microphone input of an FM transmitter ?

A) F1B B) F2A C) A1A D) J3E

After 7/1/90
Page 10-62
A) RTTY B) MCW C) CW D) Sideband phone

Answer is B.

-?) Now I'm really confused, why is F2A now MCW ?? Is MCW F2A ???
Is the answer correct ??

3AH-2-4.2
Page 10-45
What is emission type F2A ?

A) Telephony produced by audio fed into an FM transmitter
B) Telegraphy produced by an on/off keyed audio tone fed into an AM transmitter
C) Telegraphy produced by on./off keying of the carrier amplitude
D) Telegraphy produced by an on/off keyed audio tone fed into an FM transmitter

After 7/1/90
Page 10-62
What is tone-modulated international Morse code telegraphy ?

B) Telegraphy produced by on/off keyed audio tone fed into a CW transmitter.
Answer is D.

-?) Is this MCW ??

3A-2-5.1
Page 10-45 What is emission type F2B ?

A) FM telegraphy using audio tones
B) FM telphony
C) FM facimile using audio tones
D) PM television

After 7/1/90
Page 10-62 What is the emission designated as "MCW" ?

Answer is A.

???? I thought this was AFSK RTTY ??? Should A) be "FM telegraphy using on/off keying of an audio tone ? " Or should the quesion be what emission designates AFSK RTTY ??

3AH-2-5.3

After 7/1/90
Page 10-63 What emission type results when an AF shift keyer is connected to the microphone jack of an FM phone transmitter ?
A) SS
B) RTTY
C) MCW
D) Image

Answer C.

??????? I thought the answer should be B, any explanations ???

I guess the question I am asking is:

1) What is MCW ??
2) Is MCW = AFSK RTTY = F2B ??
3) What is FM Telegraphy using on/off keying of an audio tone fed into the input of the microphone ?.

Chapter 3 "Radio-Wave Propagation

On page 3-2 it states that:

As radio waves pass through the ionosphere, they give up energy. This sets some of the ionized particles into motion. Effects of absorption on lower frequencies are greater than on higher frequencies. Absorption also increases proportionally with the amount of ionization. The more ionization, the more energy the radio waves lose passing through the ionosphere. Absorption is most pronounced at midday. It is responsible for short daytime communications ranges on the lower amateur freqencies (160,80, 40meters).

On page 3-6 it states that:
Maximum ionization occurs during a sunspot cycle peak. High sunspot numbers usually mean good worldwide radio comunications....

????? If absorption is proportional to the amount of ionization how could you get good long distance communications during a high sunspot number when ionization is at maximum ?????

If anybody can explain answer these questions please reply or post on notes.

Thanks in advance,

Ham in training,
Mel

I have been following the thread about DSP technology allowing much weaker signals to be copied than is possible with good receiver + CW + human ear. It is not clear to me why similar technology can't be applied to CW signal detection in order to allow the reception of even weaker signals than is currently possible. Am I missing an important point about the nature of the computer-generated signals that are currently being picked out of the noise by DSPs that makes application of this technology to CW signals inappropriate?

-Just wondering

Subject: Calls, Manuals, and reply Comments

Logic **WARNING** ! This message contains three completely separate topics.

Better that than wasting valuable bandwidth on that STOOPID header that I can't suppress.

1. Callsigns: All the talk about phonetics reminded me of the YL operator I worked this past Field Day. She was at WB6LRU -- WB6 "Lacy Red Underwear" (Boy, did that ever attract attention on 10 phone ;-))

2. Getting no response to my plea for an Autek QF-1A Audio Filter manual last

month, I'll ask one last time if anyone out there has one. Copying and postage costs gladly reimbursed.

3. Now that the comment period is over for PR 90-55, could some kind soul please post the format/procedures for filing reply comments?

73 and aloha,

Jeff Miller WD6CQV/KH6 AFA8JM
1843EIE"at"HICKAM-EMH.AF.MIL

P.S. Is there anybody out there who can do better than "We Do 6 Clearly Questionable Vices" for my call? Maybe it's time to put in for NH6XX :-) .

I heard through this newsgroup some months ago that Jim, V31BB, had passed away. I was wondering if anyone could either categorically confirm or deny this rumor. Regardless of what others have said about him, Jim was always interesting to listen to and strenuously enforced good operating procedure from others. I'd hate to think that this unique and interesting ham has become a silent key. Any information would be greatly appreciated.

Ohhhhhh......I don't think so! This has been tried during some of the
"repeater wars" in Southern California, and believe me, the simplex
operators were cited!

SB ALL @ AMSAT $ANS-216.01
UPDATE ON UOSAT/MICROSAT BBS

HR AMSAT NEWS SERVICE BULLETIN 216.01 FROM AMSAT HQ

SILVER SPRING, MD AUGUST 4, 1990
TO ALL RADIO AMATEURS BT

UoSAT / Microsat BBS Passes Alpha Tests

During "Colloquium Week" at the University of Surrey (UoS), Harold Price, NK6K and Jeff Ward, G0/K8KA, made significant progress in testing store and forward communications software on UO-14. This software will also be run on AO-16 and LO-19 after it has been completely tested and debugged on UO-14.

Once Harold arrived at UoS, he and Jeff went directly to work loading the 210 kbytes of code to UO-14 for testing. The tasks loaded were: hit.exe (the Housekeeping Integration task), cpe.exe (the Cosmic Particle Experiment data collector), mfile.exe (the RAMDISK file system server), tlm.exe (the telemetry server), qax25.exe (the AX.25 "virtual TNC") and ftl0.exe (the BBS itself "File Transfer Level 0").

During the course of the week, it was necessary to re-load the software 5 times, to overcome operational glitches and install bug fixes. When the satellite wasn't in range, memory dumps were examined and new code versions were compiled and ground-testing. For ground tests Jeff and Harold used 2 IBM Real-Time Interface Co-processor cards (in their respective PCs) and the UO-14 engineering model (at least the bits of it which would fit onto Jeff's desk).

To stress the software and reveal bugs, they started a bulletin broadcast, which fills any free downlink time with UI frames. With this running, they connected to the BBS and downloaded a 30 kbyte file. Throughout the test, European stations continued digipeating. After downloading the file twice without incident, the 'alpha tests' were declared complete.

The success of the hard work performed by Harold and Jeff now clears the way for the following activities:

(1) Release of the UoSAT/Microsat PACSAT protocol specifications. Complete definitions of PACSAT File Headers, PACSAT Broadcast format, and the File Transfer protocol Level 0 will be freely available. All of these have been in draft form for some time, and Harold is getting final versions ready for publication in the ARRL Networking Conference proceedings. If all goes well, they should also be available in electronic format in early fall.

(2) Development of user groundstation software for BBS access.   The FTL0 protocol is designed for automated access (not hunt-and-peck keyboard control). Once fully tested, this software will be made available through AMSAT-UK and AMSAT-NA thus making UO-14 truly open for access.

(3) Porting of the file system and the FTL0 BBS to AO-16. Although most of the code will run without modification, there are some differences in satellite hardware and "operating philosophy" which must be accounted for. This specifically involves drivers for the RAMDISKS, and support for ALOHA access on the A0-16. (UO-14 will use an experimental reservation multiple access scheme, with only limited ALOHA contention.)

This is, of course, taking longer than a similar BBS-only effort would on the ground. Remember that UO-14 is simultaneously running six programs: sampling telemetry, collecting data from the Cosmic Particle Experiment, providing a multiple-connection virtual TNC, broadcasting using a new point-to-multipoint protocol, and waiting for full-duplex binary file transfers at 9600 bits/second. Including DOVE and WEBERSAT, 6 programmers in 2 continents and 4 time-zones have collaborated to bring this together.

[ANS thanks Jeff Ward, G0/K8KA for the information for this bulletin]

AMSAT-UK COLLOQUIUM, PART 1

HR AMSAT NEWS SERVICE BULLETIN 216.02 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 4, 1990
TO ALL RADIO AMATEURS BT

The following summaries from the AMSAT-UK Colloquium were received from Richard Limebear, G3RWL.

The Colloquium was held at the University of Surrey, England from July 26 to 29, 1990. Over 200 people from about 29 countries were in attendance. This annual event is one of the premier Amateur Satellite sessions held anywhere. Additional details are forthcoming in an upcoming issue of OSCAR News.

* Russian Satellites *

The RS14/RUDAK-2 launch has slipped, the current word is October 1990. Apparently the RSM modulation promised stands for Rectangular Spectrum Modulation but no other information about it is available at this time. The 70cm link will apparently use an RHCP aerial while 2m will use a dipole. Only one transponder will be switched on at a time and that will normally be RUDAK; the analogue transponder is considered to be a reserve.

** BADR-1 New Satellite **

SUPARCO (the Pakistani Space & Upper Atmosphere Research Commission) launched a small UoSAT-2/FO-12 class microsatellite into orbit on 16 July 90.

The Keplerian elements indicate that this orbit is pretty eccentric; as much as FO-20 but a lot lower in altitude. Perigee/apogee at this time are about 198/982 km but by November they'll be 125/900 km - in other words it won't live long. Also, with an inclination of 28 degrees, perigees close to the UK won't rise above the horizon there.

Information received from Suparco says that telemetry is of the UO-11 type; the two transmitters are on 145.825 and 144.028.

AMSAT-UK COLLOQUIUM, PART 2

HR AMSAT NEWS SERVICE BULLETIN 216.03 FROM AMSAT HQ

SILVER SPRING, MD AUGUST 4, 1990
TO ALL RADIO AMATEURS BT

* FO-20 *

At the Colloquium JARL said they will issue an award for Mode JA operations. It was pointed out that satellite users could do with some more mode JA time; some arrangements were made for this and also for the FO-20 operating schedule to be PUBLISHED in the future.

** ARSENE **

F6BVP gave a comprehensive presentation about their long awaited satellite. ARSENE (Ariane Radioamateur Satellite pour l'ENseignement de l'Espace) will be mounted INSIDE the Ariane rocket's separation collar on the September 1992 flight carrying the Telecom 2B payload. The final orbit is expected to be equatorial with apogee = 36,000 km and perigee = 20,000 km with a period of seventeen and a half hours. Visibility figures for the UK for this type of orbit are "interesting" to say the least - the longest pass seems to be about 31 hours and gaps of 48 hours between passes will occur from time to time.

A solid fuel rocket motor will be used to raise the perigee after launch into Geostationary Transfer Orbit. This spin-stabilised satellite will carry three deployable solar panels and be earth-pointing using nitrogen gas for attitude control; lifetime expected is on the order of five years. The six-sided body will measure 900mm in diameter, be 880mm high and weigh about 140Kg before the kick motor firing.

The communications payload will have a 70cm uplink and 145 and 2445 MHz downlinks; the two modes, B and S, will NOT operate simultaneously. Mode B operation will be FSK packet radio (3 uplink channels, one downlink) and mode S will be a linear transponder.

** AMSAT-Isreal **

Amsat-Israel announced that they intend to follow the example of universities abroad and launch their own satellite project. Plans are for a small store-and-forward spacecraft, perhaps also carrying scientific experiments.

SB ALL @ AMSAT $ANS-216.04
AMSAT-UK COLLOQUIUM, PART 3

HR AMSAT NEWS SERVICE BULLETIN 216.04 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 4, 1990
TO ALL RADIO AMATEURS BT

** UOSAT-F **

There is a proposal for the UoSat-F spacecraft to be launched on an Ariane flight in April 1991. If the proposal is realized, Amsat-UK will make a significant donation to the project which is also hoped to carry a Mode A transponder.

** PHASE-3D **

Design requirements for the Phase-3D satellite were discussed. The plan is to improve links by more than 10dB above AO-13 levels by using more power, more antenna gain, and anti-alligator measures. The preliminary specification has a 250W PEP transmitter in a 3m diameter toroidal shape weighing 400 Kg. Amsat-DL would like it to carry X-band (10GHz) and other microwaves plus experiments and educational features as well as the "normal" communications payloads.

SAREX IS #1 FOR LAUNCH

HR AMSAT NEWS SERVICE BULLETIN 216.05 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 4, 1990
TO ALL RADIO AMATEURS BT
NASA Has Set Tentative Launch Date for ASTRO-1 / SAREX Mission

NASA will roll out the Shuttle Columbia to the launch pad in the next few days, having repaired the Hydrogen leak that forced a rollback to the VAB (Vertical Assembly Building) in May. Although the final date and time will not be firm until the Final Readiness Review, which is held about a week before launch, a tentative date of September 1 at 5:00 GMT (23:00 EDT on Aug 31 on the Cape) has been set. The night launch should provide dramatic visuals for the sendoff of Ron Parise, WA4SIR, and the SAREX mission.

While Ron is tending to his duties as a Mission Specialist on the ASTRO-1 project, his amateur station will be busy acting as a Packet Radio "QSO-Robot". During his "off time" Ron will be actively making contacts on 2 Meter FM. Ron also plans to spend time communicating directly with school children across the country. A number of schools have been selected to communicate, using amateur radio, to Ron while he is in orbit. This will provide the students the opportunity to ask him questions about his mission as well as space travel in general. In a sense, the long delay of STS-35 can be viewed in a positive manner. Many of the students which will participate in Ron's "classroom visits" will be back in school and not out on vacation as would have been the case if Columbia was launched in July or early August. What a great way to start the school year!

Live Shuttle audio commencing prior to the launch and continuing throughout the entire mission of SAREX will be re-transmitted from the Amateur Radio Club Stations at Goddard Space Flight Center, Greenbelt MD (WA3NAN), the Johnson Space Flight Center, Houston, TX (W5RRR) and the Jet Propulsion Laboratory, Pasadena CA (W6VIO). Stay tuned to ANS for further details as they become available.

[ANS thanks Bill Tynan W3XO, AMSAT VP of Manned Space Programs for the information in this bulletin]

WO-18 SPACE SCIENCE STUDIES

HR AMSAT NEWS SERVICE BULLETIN 216.06 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 4, 1990
TO ALL RADIO AMATEURS BT

WEBERSAT-OSCAR-18: Space Science + OSCARs = FUN!

Curious hams often wonder if science can be fun. Combine space science with OSCARs and you get an unusual mix of exhilaration and excitement by observing a phenomenon that would be missed in normal daily life. This is what the students at Weber State University (WSU) discovered when they recently noticed that WO-18 was going to pass through a total solar eclipse as its orbit took it over Finland and Siberia. Ground controllers took advantage of this fact and quickly started to prepare to take pictures of this event using WO-18's CCD camera. It was their hope to snap a picture of the earth as WO-18 passed through the penumbra and umbra. Also, the Whole Orbit Data (WOD) telemetry mode was programmed so that solar panel array currents could be recorded and examined later. The very difficult task of planning the telemetry capture and picture taking during this event was quite taxing, however, it paid off as the WOD data revealed that WO-18 did indeed pass through the solar eclipse at the exact predicted time. The CCD camera was programmed to take eleven pictures, one every 13 seconds. The first picture was to be snapped at 02:42:35 UTC on July 22. As WO-18 came back over WSU on the next pass, an immediate dump of the telemetry showed that the their predictions had been perfect. The WOD showed a marked decrease in solar array current. But alas, no pictures were taken which accurately showed what the earth looked like during an eclipse. Although that is what WSU engineers wanted so see the most, this time it was did not happen. Not to be discouraged, in future solar eclipses, WSU engineers plan to do this again until they do snap a picture of the earth during a eclipse.

In another interesting scientific observation, the microscopic particle impact detector on WO-18 recorded a significant number of collisions during a recent meteor shower! During one day the impact detector noted eleven hits during one orbit. Normally, the impact detector only records two collisions a day! Once again, WSU engineers will be planning WOD operations during future meteor showers as they continue to study this.

Chris Williams (WA3PSD) reports that significant progress has been made in further refining picture taking strategies. WSU engineers now have a better understanding of how to use the information from photo cells to determine when WO-18's CCD camera is looking down at the earth. Also, new software algorithms to decide when to take pictures are being developed.

Finally, WA3PSD announces that WSU will be sending out a beautiful QSL card to those amateurs who have either captured telemetry or a picture from WO-18. Send your hardcopy of telemetry or data to:

WSU/CAST
Eng. Tech. Bldg., Rm #236
3850 Harrison Blvd.
Ogden, UT 84408-1805

WA3PSD joked that white pieces of paper or totally darken pictures don't count. It must be a real picture. Hi! Please include an SASE to expedite the return of your QSL card. For more information about the availability of WeberWare 1.0 which will process the image data from WO-18, contact AMSAT HQ's at (301) 589-6062.

SB ALL @ AMSAT $ANS-216.08
AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 216.08 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 4, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on July 3.

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 190

```
         Mode-LS         : MA 190 to MA 195  (Mode S Beacon only)
         Mode-S          : MA 195 to MA 200
         Mode-BS         : MA 200 to MA 205
         Mode-B          : MA 205 to MA 240
         Off             : MA 240 to MA 003
         Omni Antennas   : MA 240 to MA 060

Cross mode B and S QSOs are possible from MA 200 to 205.

The current attitude estimate:
BLON = 207  and  BLAT = +1

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to
support Mode-B transponder operations, therefore, the transponder is available
for general use whenever AO-10 is in view at your location.  Please DO NOT use
the transponder if the signals are FMing.  The current estimate of AO-10's
attitude is   LON 24 deg    LAT -9 deg.

Much activity has been heard on AO-10 centering around a popular calling
frequency of 145.910 MHz.

I don't think this will work. I believe this has been tried by some of
the participants in various "repeater wars", including the allegations
by the simplex operators that THEY were the ones being vicitmized by
the repeater operators.

This trick is so old, that I have not even heard of it being used since
the 1970s.

Dujmich) writes:
-I just bought a new Kenwood TS-940S. The manual says that the
-fan on the heatsink on the back will hardly ever come on during "normal"
-use. The manual further says that the fan will cycle on and off during
-operation. My fan is off when I first power up the radio, but once it comes
-on, it stays on. This occurs even if the transmitter is never used, and I stay
-in receive mode. The heat sink itself stays warm, even with the fan running.
-Is this *normal* ? I can't ever say that I've seen it cycle on and off.
-Do I have a problem, or is this the way they all work?
-
-Paul
-WA3TLD

My 940 (purchased in April '87) works as described in the manual. The
fan only comes on during long periods of transmit. The fan never comes
on in receive mode.

Sounds like something is wrong. Call ICOM!

Paul Nix (WB5AGF)   InterNet: nix%muppet.decnet@consrt.rok.com asks;

<...I'm less sure of how to handle the money situation...>

Paul,

Most, if not all Ham places here will take credit cards. Mastercharge is called Access, Visa is called Visa or Barclaycard. They'll happily charge you in pounds sterling and the credit card companies take care of the exchange rate. It's generally an O.K. rate.

Alternatively, you could open an account at a U.K. bank. I believe Barclays operate in the US (I saw a branch in Boston, so I suppose they do.) That way you could send a cheque in pounds sterling drawn on a UK bank, but actually put money in the account in the US. (I have a very similar arrangement, only the other way round, with a bank in Philadelphia.)

73,

Hugh, G0CNR.

Paul Nix (WB5AGF)   InterNet: nix%muppet.decnet@consrt.rok.com asks about buying stuff in the UK.

I forgot; MAKE SURE YOU GET THE VAT BACK!!!!

All the prices you see in RadCom include 15% Value Added Tax, which as a non-resident of the UK you are entitled to reclaim. It's a tedious procedure, but on a $1000 rig, very worthwhile.

When you order the stuff, make sure the retailer includes a VAT reclaim form. This needs to be stamped by the US Customs to prove the stuff's been imported into the USA (or more precisely, *exported* from the UK), and then returned to the UK Customs. They in turn will send you your money back.

There may be a lower limit on the amount you can do this on - I think it's a retail price of #50.

73,

Hugh, G0CNR.

Most of you people don't know what real repeater wars are like. Early in my ham career (i.e., 20 years ago) , there were several of them in the Los Angeles area that were famous as far as way as San Diego.

Simplex on the input? Child's play. What really cured repeaters in those days were chainsaws.

Seems that someone decided (pre-coordination, pre-ARRL-discovering FM, pre-ricebox radios) that despite the hundreds of simplex operators on

146.76, Los Angeles needed a 16-76 repeater, since, after all, that was a national repeater channel.

As the Chronicles of 76 report it, one day it went off the air. Upon arrival at the site, the owner found that the power and coax cables to his phone-pole-mounted outdoor cabinet had been chopped.

A few weeks later, it went off the air because all the tubes had been removed and smashed.

Finally, a few weeks after that, it went off the air because the cabinet had been cut in half vertically with a chainsaw, and the phone pole chopped into fireplace-sized chunks.

To this day, there is no 16-76 repeater in LA. And the coordinating committee has ALWAYS considered the simplex people when allocating channels. They never put a repeater on 34-94 for the same reasons. (A few years later the Mexican's clanked on 94 and 76 with their own repeaters, but that's a different story.)

No one was ever prosecuted for that stuff that I heard of, but one of the guys we guessed might be the one (no evidence; it just seemed his kind of thing) spent some time in the pokey on some unrelated charges, and later some time in outpatient treatment. He's dead now - private plane crash, I'm told.

Think of it as a saga of the Old West, ham style. Nowadays we just patch up the bulletholes in the buildings.
     - Brian

Go for it the test is only 25 questions and should be a snap if you spend about 2-3 hrs studying.

You missed it Phil, the exam does not fully make the HAM. Think back to that first QSO you had, sweaty palms, nervous stomach and a jitters so bad you couldn't even hit the xmit button square. These people need a place to "paractice" (don't give me that c*** about perfect practice) without banging up the rest of the system. That was the intent of the segregated bands for Novice and Tech licences and should be for the Communicator licences. When they want more frequencies then let them get a full Technician ticket and have full Technician privilages.

If they want to "communicate" then they will keep Communicator class licences, if they want something more then they should get a class of licence which is intended to do more.

There is still a big identification crisis with this Communicator class licence particularly when they want to eliminate existing levels of licences and merge privilages the way it has been proposed.

I would love to see privilages for an entry level class which INCLUDES hf CW without requiring the current Morse test scenerio. It would go a long way toward building a strong HAM fraternity. I like the idea of being able to atleast send some Morse rather than just receive, heck, are we trying to licence SWLs??

Tell me, Phil. Are you of the opinion that ALL Communicators are going to want to jump right in and be TCP/IP priests and are going to behave the way 13cm weak signal jocks do? Will you admit that the vast majority of these Communicators will want to "communicate" and will probably act like CBers and HFers?

I am not going to claim that there will be hordes of Elmers waiting for these new HAMS but there will be a few and they will help and the word will spread and there will be a reasonable number who will upgrade for more privilages, for personal satisfaction and to protect their investment. Be practical, yes, they are HAMS, many will act like HAMS and more will not act like HAMS. I'll do my part to guide or convert those I contact but PLEASE, because of the probable nature of the majority of these new HAMS don't let them mess up an already shakey band.

Certainly you won't read much about DSP in QST until it's being advertised in the back. However, it's been discussed here on the net, at various ARRL conventions and specialized conferences, and quite a bit in the electronics literature. I first read about it in Ham Radio (RIP) magazine.

There is a DSP mailing list; there are experimenter's kits for DSP, and I've seen demos of a reasonably complete DSP system at local ham clubs. I seem to recall someone is going to give a talk on it at the SW Div ARRL convention three weeks from now. Even the ARRL Handbook talks about it a bit, although not in any useful manner.

In the 'hamradio' anonymous FTP area on UCSD there are a number of dsp programs.

Hmmmmmmm....
When I was going from 5 to 13 WPM for my General I practiced every night
for 20 to 30 minutes... +MY+ wife never complained... In fact she
encouraged it... She saw that Ham radio is a +GOOD+ thing. What she
liked is listed below:
     - Cheaper than a shrink. Ham Radio is very good relaxation and if you
have a high stress job becomes a haven.
     - When I am playing with radios, I AM NOT doing the following:
          - Drinking
          - Running around with the guys
          - Running around with another woman
          - (aka she knows where I am)
     - I can be interupted and I can do something with her.
          (I may need 15 minutes to finish a QSO, but that is OK)
     - It is fantastic for emergencies. When the big quake hit in October 89
she turned on the 2 meter radio in the car and could hear all of of the
HAM people that she had meet at club breakfasts and dinners. This gave
her the feeling that she was not alone even though I was 6 thousand
miles away in Taiwan. If she got into a life/death situation she could
+USE+ the radio to save her or someone else! (No flames on this...
Sheesshhh)...

So explain some of these things to your YL/XYL and see if she becomes
more +BEEP+ tollerant!

Oops, sorry, you wanted some citations. Most of these are popular
journals, so it's your library will have them; if not, the UCSD
libraries have most of them and you're welcome to come and browse if
you're in town for the ARRL convention.

These are only recent articles; our on-line current contents catalog
only goes back a year or two.

Certainly test-taking is a skill, but it's one whose bearing on the proper operation of an amateur station is marginal at best. And I don't know if "most" of the people who pass the upper-level writtens forget everything, but I've met plenty of Extras who I personally would not want teaching too many newcomers. I remember taking my Novice test, way back when, from an Extra who marked my answer to the following question as "wrong":

Question: How many times per second does a 60 Hz AC voltage pass through zero?

I'd answered "120", and try as I might, I couldn't convince this guy that the correct answer WASN'T "60"! And THIS was supposed to be an example of the All-Powerful-All-Knowing-Amateur-Extra?!??! Didn't make much of an impression on this Novice-to-be, let me tell you.

No, I don't hold an Extra today; I've no interest in DXing, and the slight extra bandspace isn't worth taking a 20 WPM test. I don't consider myself the technical inferior of the majority of Extras, though, and I DO know a number of Tech licensees that I consider just short of Maxwell and Edison in the technical hierarchy. Let's dump "punishment licensing" (as Wayne Green used to call it) as soon as we can!

    <list of articles>

Nice list of articles on DSP, but from scanning the titles, nothing dealing with how you could use it decode a signal so weak that you couldn't even hear it if it was CW (as stated in the first DSP vs CW posting).

Cal Eastern labs will supply spice models for a few of it's GaAs FETS.
I know they've got data for the NE710. If you can't get it from them,
write me, I'll dig it out. The model in Spice3c1 isn't too good, it's
based on Statz, et al, and has significant limitations. Make sure you
read the papers before plugging in and running.

> Any of the current handhelds are ok, but not in the car.

Actually, with a decent rubber duck antenna my FT411 works pretty well in my Datsun around town, especially if I plug into 12V and set high power (5.5W). Not nearly as well as with an external antenna, of course, but quite usable.

> You will find that the audio is not loud enough to listen to comfortably
> over the road noise...

Easy fix. Buy a couple of "ear buds" (for example, Koss, ~$5 at WalMart) and a stereo to mono adapter. (I have to turn the volume way DOWN to use them...) You can hear outside noise just fine with them on.

> The best car antenna is a 5/8 wave mounted in the center of the top.

However, a 1/4 wave is a heckuva lot shorter and nearly as good.

>Phil, what is the practical difference between the suggestion above and the
>current situation when a person upgrades but keeps his old call sign? Whether
>it's called a "class" or an "accreditation" or etc. doesn't much matter.

Brandon, it was I and not phil who proposed that the CSCE be kept with a 30 day suffix. The difference is that changing your license class requires the FCC to update the main computer files and send you a new form 660 with a new expiration date, etc. A CSCE need merely be kept in a list for enforcement purposes, so when somebody is heard in a band that requires a CSCE, the FCC can look it up if they care. It _may_ be a bureaucratic shortcut, and the FCC is looking for that sort of thing.

I admit to not being up-to-date on the status of the 900MHz band, but assuming that there's still a place for ATV there, I saw something in the most recent DAK catalog that might be of interest.

They are now selling a gadget that attaches to your cable hookup or VCR (or other video source) and broadcasts it (via 910-918MHz) to a small receiver that you can attach to your TV. I know nothing about it other than the fluff DAK used to describe it, but it sounds like it might be a reasonably cheap ($105 for the set) way to build a 900MHz ATV exciter. It shouldn't be too hard to move it within the amateur band (I would hope).

The flip side of this is that shortly your neighbors may be filling the entire 910-918 Part 15 band with Three's Company...

I recently passed my novice and Tech test (haven't recieved them yet).
I purchased a Ten Tex Omni-D and have been listening to you all talk.
I would like to find mods for this rig, even though I wouldn't use them for
a while. I have the 10mhz transmit and WARC transmit mods from Ten Tec,
(Ten Tec IS as good at customer service as you have heard). Any mods,
or war stories would be appreciated. The rig seems to receive fine, and
all the built in filters are terrific (especially the CW ones) but I think
it could use some help in the SSB audio department. Anyone have any nice
audio filter/speaker projects that might help me out ?

Thanks

> I plan on taking the novice exam in the next couple of weeks.

Good luck!

> I have a question, is it a good idea to take the technician element at
> the same time?

It is a good idea, once you pass a test element, to attempt the next
level, if time permits and the examiners don't mind. For instance, when
I passed the Tech two months ago, 100% after thorough studying, I gave
the General exam a shot with zero preparation -- and only missed it by
two questions. If I'd passed it, I'd have had incentive to bone up on
code and upgrade within a year.

Don't burn yourself out studying, however.

Has anyone given thought to using a computer generated number which
a DX station would send along with the RST/RS to confirm that a
contact had been made. This would be used to replace the QSL cards
and the associated delays and costs.
Perhaps, the DX station could receive an encryption key which is hashed
against the call sign of the station worked, band and time. An algorithm could
then generate an encrypted confirmation number. All
that would be needed for an award would be a list of stations worked
and the encrypted confirmation number. The awarding agency could verify
the authenticity of the contact through the encrypted confirmation
number. Any thoughts on this is idea ... OR for that matter any
thoughts about the nature of the cypher algorithm?

*

I'm crazy about my ICOM-24AT: good transciever, good scanner(police, fire and some unmentionabe stuff around 800MHz),light, and lasts faily well on portable power.

*

>I also just bought the Radio Shack PRO-34 scanner, but am not particularly

*

I bougtht a PRO-33 on sale and then traded up to a PRO-34, (when it went on sale), I like it a whole lot better than the "33" but and case isn't a problem since I use it mostly in the shack. A soft case shouldn't be hard to come by. I have read that the audio isn't that great, but inside an external speaker is fine, (DAMARK had a pair of small speakers for $20), and outside I use an earphone so I can hear the audio above the racket and conserve power.

I would be interested in communicating with any Radio Amateurs who are interested in the Solar Eclipse next year, July 1991. I will be going to the eclipse in Baja California, with a mobile HF rig, and it might be useful to have a network operating to pass along information leading up to, and during the eclipse. Perhaps a weekend network on 20 meters? Ideas anyone?

I don't know how other areas view ham radio, but the local agencies here think it is great, especially packet radio.

Our local county Emergency Services director applied for a FEMA grant for packet equipment. FEMA set a record for replying to a grant (they said ham radio? no sweat!) and gave a 50/50 grant. FEMA put up $3K to match the count county's $3K for a total of $6K to buy two complete portable packet sets, including synthesized two meter radios, TNCs, laptop computers with printers and nice crushproof cases to carry it all in. They think they'll have enough left over to buy one or two extra radios and Henry's TNC/printer combo for installation in a couple of receive only locations for unattended (by hams) locations.

Yes, up here in the Great White North ham radio is an integral part of the public safety system.

We are designing a repeater controller interface circuit with both analog and logic portions (unique, eh?). We decided to use separate analog and logic grounds to reduce the switching noise appearing in the audio circuits.

Now we have two grounds internal to our circuit board.
What do we do with them?

If we tie them together at one external point, does this still
retain the benefits of the separate internal grounds?

Do we need to provide some other means of isolation before pulling
the analog ground to 0 Volt potential?

I don't think a "computer" license is a good idea. It places emphasis on the computer instead of the radio. I also don't see a very large portion of the amateur community in support of this.

One of the key thing would be the number of users of such a service. If there were enough users that they would make good use of such an amateur band, then there would also be enough to ask the FCC to allocate a "CB" like band for such a service. The power and range would not be very high for such a system and there would only need to be a 20-40 khz spacing for a few channels.

It's just that if some amateur space were split off for computer service, it would be seen with the same light as the UPS chopping 220. The new users would not be ham-radio operators.

We are looking for ideas on buying/building a good 6 meter base station
antenna. There is one catch, it must be extreemly heavy duty.

This is for a mountain top repeater installation where the winter weather
can be quite severe. Previous antennas have been constructed out of EMT,
IRON pipe and stainless steel whips. All of these antenna ideas have
given in to the ice and wind.

What do you use? What would you do?

Thanks in advance.

]
]
]Ohhhhhh......I don't think so! This has been tried during some of the
]"repeater wars" in Southern California, and believe me, the simplex
]operators were cited!

Cited for what? In order to be cited for harmful or malicious interference,
they have to operate WHILE someone else is using the frequency, in such
a manner as to cause interference. Believe me, having been the point man
here in a repeater war (our group was NOT the agressor), I can tell you
that it is not easy to get an FCC NOV in one of these cases. By the way,
the Long Beach, CA branch of the FCC was the one involved in that case.

Cited for failure to maintain Good Amateur Practice? Perhaps, IFF the
other repeater was coordinated. On the other hand, some of us consider

closed repeaters to be failure to maintain good amateur practice.

Let me comment that my original suggestion about talking on the
INPUT frequency was probably not appropriate, since you can't tell
if you are causing interference. Perhaps I should have said OUTPUT
frequency.

I was personally involved in getting the FCC to recognize coordinating
bodies because of this sort of tactic. If a repeater is coordinated,
the FCC claims that they will give it primacy on its frequencies (which
is a good reason to not coordinate any more frequencies to closed repeaters).
If it is not coordinated, it is just another repeater.

The reason I used the word "toothless" is that the FCC is very reluctant to get involved in repeater coordination wars. There have been several cases where there were battles between coordinating bodies. The FCC stance has been to either stand aside and recognize BOTH groups (which is, of course, absurd, but happened in Sourthen California) or to ask for a vote of the USER COMMUNITY (I believe this was suggested in Kansas City)!

Note that current coordinating bodies (such as the one here in AZ) are usually controlled by existing repeater owners, who have a clear conflict of interest in their position. Some years back I discussed this problem with Carol Foelak (at that time the lawyer for PRB ham radio issues) and she agreed that they had no good way to deal with competing coordinators, that the conflict of interest in the coordinating groups was the Achilles heel of the system, and that the interests of the USER's must be considerd in coordinating decisions.

So, if someone wants to cause trouble (or maybe even do some good, although I don't generally like such tactics), they can set up a competing coordinating body that refuses to recognize the closed repeaters. If they are clever, they will appeal to the USER community (which, of course, does not have a large percentage of closed repeater users) and maybe win FCC recognition OVER the old coordinating body.

As the need for frequencies gets more intense, more of these disputes will arise. Today, there are many frequencies, throughout the country, that are RESERVED for tiny groups with a few members. Also, there are large organizations (such as Cactus) that tie up a large number of wide area frequencies for their private use [I should note that Cactus has made their system available in emergencies, but only if Cactus members are available to control it.] This cannot continue. Where are we going to put new mode repeaters? What if a large organization wants to experiment with trunking technology (which would greatly relieve band congestion)? Where do they get the frequencies? How about digital modes (packet, digital voice, TDMA digital voice, etc)? Why should almost all frequencies be tied up so that these private groups can occasionally use a quiet FM frequency?

>there was a CW signal there.

And you would talk to yourself, since no one else would be suitably
equipped to receive you similarly.

Also, you would spend a lot of time you don't anticipate writing special
code to cover for flutter, to make a myriad of interpretative reconstructions
of received sounds (unless you just reconstructed tones and used ear/brain
for data reconstruction, heaven forbid), and trying to get another person
or two to do the same so you could conduct meaningful communications.

This would be highly educational. Since this receiver is easily-built,
(and presumably inexpensive) I'm eagerly awaiting the details in QST,
QEX, the AMSAT-NA Journal, PSR, or some other periodical with a technical
section.

>
>The supposed advantage of CW for weak-signal work is an illusion with

Could someone post whether or not the US and/or foreign
CALLBOOKS can be obtained by anonymous ftp? Others
must have the same question.

Assuming they can be obtained by anonymous ftp, is there any
freeware which can be used to work with them?

Thanks,

Tom N5EVM (US) VK8KTH (Australia)

In article <82@thoreau.nsc.com>, rtodd@thoreau.nsc.com (Ron Todd) writes:
|> You missed it Phil, the exam does not fully make the HAM.

I'm not sure which Phil you're talking to, but I assume it's me. And no,
the exam certainly does not fully make the ham. I took my last test in 1973,
before I had even left high school, and I'd like to think that I've learned
something since then.

|> Tell me, Phil. Are you of the opinion that ALL Communicators are going
|> to want to jump right in and be TCP/IP priests and are going to behave
|> the way 13cm weak signal jocks do?

Of course not. But I don't see any other way to bring in the TCP/IP "priests" (and other technically oriented people) without it. There will always be chaff with the wheat. But at least we won't be throwing out the wheat.

> Will you admit that the vast majority
> of these Communicators will want to "communicate" and will probably act
> like CBers and HFers?

You use the terms "CBers and HFers" as a disparaging epithet. But have you actually LISTENED to the SSB CBers and HFers? I have. Except for the lack of callsigns and an apparent inability to standardize on either USB or LSB, they sound EXACTLY like the legit hams I hear anywhere else on HF. They carry on the same inane conversations about personal health problems and the like. Well, perhaps they're a LITTLE different - the HFers know they're operating illegally, so they seem to be a little more polite on the air so as not to ruffle any feathers. (1/2 :-))

By the way, the main reason I support no-code is NOT just because I happen to be interested in technical work and would like similarly minded people to join. That's only part of it. The REAL reason is that a no-code license is absolutely essential if amateur radio is to do the only thing that can possibly justify its existence much longer -- by interesting young people in science and technology. The FCC certainly doesn't think that 0.2% of the population have a god-given right to a disproportionate share of an important natural resource to ragchew and pursue what amounts to high tech stamp collecting simply because they've passed a code test.

Start thinking in terms of how the NON-amateur world views amateur radio, not in terms of how hams view ham radio. Remember that there are many more non-hams than hams, and they control all the frequencies.

Phil

Weak signals? Ask someone who uses the 1750 meter band!

Over the last year, the "Lowdown" (the publication of the Longwave Club of America) has carried a series of articles by Max Carter detailing a system for receiving and decoding slow BPSK (binary phase-shift keying) signals in the 160-190 KHz (part 15) band. This equipment does not look particularly complex - far simpler than packet stuff - and he reports using it to decode and display the ID's of beacons which were much too weak to be detected by ear.

I recommend this series to anyone interested in what can be done to go beyond CW for weak signal communication *and* can be put together by the average experimenter.

J. Patrick Harrington

Sure, just like everywhere else in the USA. And just as effective, too.

But don't misunderstand - it's not hams shooting at each other's buildings. It's frustrated people plinking at The Phone Company, the police transmitters, TV stations, the power company, etc. After all, doesn't television teach us that that we can solve ANY problem by brandishing a weapon at it?

And after all, you're all alone up there on the 5000 ft mountain, and there's no police around, so there are no laws, so why not just express your rage and frustration at those impersonal bureacracies by blowing a few holes in their buildings?

That's sarcasm, son.

You know, it suddenly struck me - that the latest bunch of satellites don't handle CW. They don't even have CW beacons.   Except FO-20, of course.

One small step for AMSAT. One giant leap for hamkind.

Snicker.

I refered to your article in the October 84 QEX when I requested 6 meters so that the Communicator class could experiment with meteor scatter. I wonder if they'll notice.

We don't all plan to be glorified CB'ers.

No, you can't buy it, you'll have to build it. But there's some nice development kits out there, and I rather imagine something that can plug into a PC bus isn't too hard to come up with. We'll see.

N4HY is working on some stuff. He'll undoubtedly beat me to it, since he's got things working NOW.

Honestly, I've never done RF DSP - but I've done a chunk of DSP in sonar and other oceanographic stuff, about 10 years ago, before the nice new chips were available, so I'm going to have to learn about what's available.

But DSP is clearly the way to go - hams are trailing commercial technology again, I regret to say.

What's a "research lab"? Does N4HY's basement count? Does W3IWI's? Does mine? We (and several dozen others) all have these Delanco-Spry DSP boards for our PCs. W3IWI is fond of calling them "the S-100-era DSP card" but they were enough for N4HY and W3IWI to read each other off the moon on 70cm using AO-13 class stations (100 watts, 13 dB gain, as opposed to 1KW and 25+ dB antennas). And, of course, everyone knows about the DSP-232 and other DSP products in the pipeline.

DSP is not "just research lab" technology. If you have a Telebit Trailblazer modem, you've got DSP. If you have a V.32 modem, you have DSP. If you have a compact disk player, you've got DSP. If you have a Sparcstation or NexT workstation, you've got DSP. (If you have a Mac or PC, you can get DSP, but it isn't standard.) If you see Voyager images, you're seeing the results of DSP. If you pick up a telephone and make a call outside your local area, chances are you're using DSP.

So it would seem that DSP is well entrenched in everyday practice in almost every communications field except for amateur radio. Doesn't that say something?

Is there a bulletin board for people that just want to listen to foreign-country public radio stations? I have simple questions about which world band radio I should purchase, what's a good antenna (in particular, what's a good room antenna that doesn't transform my room into a cabling station), and what frequencies provide the best reception for, say German radio stations, in the LA area.

Also, are there intelligent radios that pick a signal off several frequencies, and use a DSP to extract noise and the common signal from these frequencies to get a clean signal?

I have added a couple of files to the anonymous ftp directory at joker.optics.rochester.edu (128.151.240.1). I received one recently and just ran across the other one, which was posted in March. Descriptions follow.

dxcc.txt.Z
dxcc.arc

This is a list of DXCC prefixes, country names, lattitudes, and longitudes. It appears here in arc and Unix compress formats. This list was provided by by Bob Lombardi.

dxcc.list.Z

This list contains the following information:

1. primary amateur prefix ("*" suffix for deleted countries)
2. country name
3. continent
4. ITU zone(s)
5. CQ zone(s)
6. time zone (hours from UTC)
7. latitude
8. longitude
9. ITU prefix allocation(s) ("~" suffix for unofficial)
10. other amateur prefixes

This file was posted to rec.ham-radio in March, 1990 courtesy of Bill Brelsford.

73,
Len Saaf

Washington, D. C. 20554

In the matter of)
)
Amendment of Part 97 of the) PR Docket 90-55
Commission's Rules Concerning)
the Establishment of a Codeless)
Class of Amateur Operator License)

To: The Commission

COMMENTS OF PHILIP R. KARN, KA9Q

Summary

Amateur Radio's most important role is to interest young people in science and technology and to encourage them to pursue careers in the field. It once did this admirably. But amateur radio has not kept up with the times, and it is faltering. The average US amateur is now over 50 years old, growth is stagnant, and the code requirement is to blame.

A codeless amateur radio license is long overdue and must be created without delay. Furthermore, it must grant full amateur privileges above 30 MHz. It should not be seen merely as an "entry class" amateur license, with holders still expected to learn the code before they can become "real" amateurs.

Code proficiency is no more relevant to operation on the 50 and 144 MHz bands than it is on the frequencies above 220 MHz. Furthermore, access to the 144 MHz band in particular is absolutely essential if the Communicator license is to attract newcomers and integrate them into the mainstream of amateur radio.

The Novice license should be retained. I agree with the Commission that there are too many license classes, but this issue should be addressed in a separate proceeding by proposing that the _t_o_p (rather than the bottom) of the Incentive Licensing "ladder" be dismantled.

August 3, 1990

The Code Requirement Is Killing Amateur Radio

1. The debate over the codeless license is really a debate over the fundamental purpose of the Amateur Service. I think the existing Section 97.1, Basis and Purpose, is exceptionally well written and has withstood the test of time. Its authors knew that rapid technological progress characterizes this field, so they wisely avoided mentioning

any particular radio communications technology such as Morse Code. Instead, they used phrases such as "advancing skills" and "advancement of the radio art" to state clearly that amateur radio was expected to keep up with the times.

2. In its earliest days, Morse Code was essential to the Amateur Service and a code proficiency requirement was then necessary and proper. But that era was long ago. For many decades individuals without any knowledge of the code could have made valuable contributions to the Basis and Purpose of the Amateur Service. Unfortunately, the code requirement remained long after the reason for its existence had vanished. Today it protects only the parochial interests of those already licensed, not the broader interests of the public that entrusts valuable spectrum to the Amateur Service.

3. The intense debate over the codeless license prompted many amateurs, including me, to think long and hard about a realistic future role and raison d'etre for amateur radio in a world where spectrum, like land, is scarce and getting scarcer. Some stubbornly refuse to accept that we do not own our spectrum and that we must continually earn our allocations. Others agree that we must "pay our bills," but disagree on the best way to do so.

4. Much of my support for a codeless license comes from my own strong interest in technical development and the desire to attract more technically oriented people to the service. But I know that this alone is not enough. Most of today's technical innovations come from corporate and government research labs, not from radio amateurs; we hams simply don't have the resources to compete. Nor can amateur radio's much-touted emergency service role alone justify its allocations much longer, given the rapid deployment of cellular radio systems that have placed millions of telephones in the hands of motorists almost everywhere. In short, few if any of its specific technical or operating activities will be able to sustain amateur radio forever.

5. There is one role, however, that can easily justify the existence of amateur radio well into the future. I speak of its remarkable ability to interest young people in science and technology and to give them a ready outlet to express and develop that interest. Many technical professionals, including myself, were originally introduced as

youngsters to electronics and communications technology through amateur radio. It played a large part in encouraging many of us to pursue careers in the field. And our professions benefit everyone, not just those who are licensed amateurs.

6. This unique role makes amateur radio a valuable national resource. It justifies the allocation of precious spectrum that some argue be reallocated to serve the public's needs more directly. But young people are an even more precious resource than RF spectrum. At an age when many of my peers were still trying to figure out what to do with their lives, I knew what I wanted to do with mine -- thanks to amateur radio.

7. Today, however, amateur radio no longer attracts nearly as many young people. One oft-cited reason is the personal computer, a communications tool _p_a_r _e_x_c_e_l_l_e_n_c_e that, unlike amateur radio, requires no operator license and no code test. (Indeed, I discovered computers in 1972, less than a year after my introduction to amateur radio. If computers had come first, I might never have bothered to learn the code and become an amateur.) Another reason amateur radio no longer attracts young people is the widespread (and, I think, mostly accurate) image of radio amateurs as reactionary old men whose staunch defense of an irrelevant code requirement epitomizes everything that is wrong with amateur radio. Amateur radio should be an investment in the future, but it is now a monument to the past. And creative and talented young people are always much more interested in future possibilities than in old monuments. The codeless license is therefore absolutely essential if amateur radio is to justify its existence.

A Codeless License is Absolutely Necessary to Attract Technical Contributors

8. In my profession I regularly meet many highly qualified technically oriented people that I believe would be an asset to amateur radio. I often try to interest them in the more advanced areas such as packet radio and satellites. And in almost every case, the initial fascination quickly dissipates when I get to the "fine print" -- that knowledge of Morse Code is still required by every class of US amateur license.

9. I long ago stopped counting how many times this happened. To non-amateurs in my profession, amateur radio is a relic of a bygone era. I try to explain that amateur radio includes small, progressive groups such as TAPR and AMSAT who do their best to promote new ideas and technology. Unfortunately, getting this message across is a frustrating, uphill battle.

10. This is made all the more difficult by an indefensible code requirement. Creativity, originality and insight are uniquely human traits vital to technical innovation, and people with these traits often have a strong, built-in drive to express them. Give them an outlet, and they'll prove they're far from lazy. (Why else do so many computer hobbyists write elaborate computer programs only to give them away?) But require these people to learn the Morse Code, and you'll often run into a brick wall.

11. The problem is that for those who will never use it, learning the Morse Code is a pointless exercise in rote memorization. There's no room for creativity, and this deeply offends many of the same people amateur radio needs the most. This is especially true for young people to whom the technical side of amateur radio could be an excellent outlet for interests that are all too often frustrated in the classroom. There's already way too much rote learning in our educational system, and far too little emphasis on developing the innate creativity and capacity for original thinking in almost every young person. It is utterly tragic that amateur radio has fallen into the same trap of mediocrity.

12. Technically oriented amateurs are a dying breed in US amateur radio. The most technically oriented American amateur radio magazine, _H_a_m _R_a_d_i_o, recently ceased publication. The mainstream amateur publications in several other countries, such as _C_Q _D_L in West Germany and _C_Q _H_a_m _R_a_d_i_o in Japan, are much more technically oriented than their US counterpart, _Q_S_T. (I note in passing that both West Germany and Japan have popular no-code licenses.) The ARRL does publish a thin technically oriented newsletter, _Q_E_X, but its

circulation is small. A relative handful of highly dedicated "hard core tekkies," running on the edge of personal burnout, is responsible for virtually every recent amateur packet radio and satellite development. And just our present projects could easily keep us busy for a lifetime.

13. We desperately need an influx of new technical contributors to help share the load and to form "critical masses" around new projects. Being surrounded by professional colleagues, some of whom would be significant contributors to amateur radio were it not for the code requirement, makes it all the more painful. It's like being stranded in a life raft: water, water everywhere, but not a drop to drink.

The Codeless License Should Grant Full Privileges Above 30 MHz

14. The Communicator proposal is a step in the right direction, but it does not go far enough. Since the only difference between the Communicator and Technician licenses would be a code test, there is simply no rational justification for excluding Communicators from the 50 and 144 MHz bands or for limiting transmitter powers to 200 watts.

15. Besides its basic unfairness, limiting Communicators to frequencies above 220 MHz would have many serious drawbacks. The most important is the lessening of the appeal of the Communicator license to prospective amateurs, particularly in the less densely populated areas of the country where the higher frequency bands are lightly used. A related problem is the reduced opportunity for contact between Communicators and existing amateurs. Given the widely understood importance of quickly assimilating the newcomers into the mainstream of the amateur service, creating a "ghetto" for the Communicators is most unwise.

16. Given the rarity of Morse Code on the bands above 30 MHz, a Communicator who will have passed a written test more comprehensive than that taken by present Technicians

will be no less capable of fulfilling the basis and purpose of the Amateur Service. I therefore utterly reject the notion of such a license as merely an "entry class" license, or of considering its holders as anything less than "real" amateurs. If this influx of new amateurs causes congestion on the 144 MHz band in some densely populated areas, so be it. Although I believe this risk to be vastly overstated, the worst that could happen is that all users of the band, not just the Communicators, would be motivated to use the higher frequency bands and to improve on their spectrum management techniques.

If The License Structure Is Too Big, Simplify It - But Keep The Novice

17. The Commission says that its staff cannot process more than 50,000 amateur license applications per year. This probably explains the Commission's proposal to do away with the Novice and Technician classes when the Communicator is created.

18. I am sympathetic to this problem. The US already has more examination elements and license classes than any other country. Recent budgetary pressures have undoubtedly made the overhead of this unwieldy system intolerable. Dismantling the cumbersome and largely ineffective Incentive Licensing system adopted in 1968 would free processing capacity that would be better used to handle Communicator applications.

19. However, the Commission proposes to begin dismantling the Incentive Licensing ladder at the wrong end. Even with the new Communicator, the Novice class would continue to serve a valid purpose as an entry level license for those interested primarily in HF operation. If the licensing

structure is to be simplified, then start at the upper end. For example, given ITU HF telegraphy requirements plus the continuing need for the Novice, as few as three classes could suffice:

Novice: Novice level written test, 5 wpm code test. Privileges identical to current Novice.

Communicator: Tech/General level written test, no code test. Full privileges above 30 MHz.

General: Tech/General level written test, 5 wpm code test. Full amateur privileges on all bands.

20. All existing licensees except Novice and Communicator would be grandfathered to General. Novices could upgrade to General by taking the written test, while a Communicator could upgrade by taking the code test. A similar structure exists in many other countries and works well.

21. Although such a major simplification of the licensing structure is most desirable, it is properly outside the scope of this proceeding. The preceding discussion was only to show one way that the Communicator could be created and the Novice retained without exceeding the Commission's application processing capacity.

22. So as not to delay the creation of the Communicator, I urge the Commission to create it in a "stand alone" action, without deleting the Novice or Technician classes. The Commission could then open a separate proceeding that would simplify the entire license structure as just described. This could be done before the Commission's application processing capacity is exceeded by Communicator applications.

Conclusion

23. In conclusion, I urge the Commission to create the Communicator license and to give it full amateur privileges above 30 MHz. _A_n_y_o_n_e who can show himself qualified to pursue the Basis and Purpose of the Amateur Service -- and that most assuredly does _n_o_t require a knowledge of Morse code above 30 MHz -- must be allowed to enter.

24. I am well aware that merely creating the Communicator won't solve our problems overnight. For it to succeed, existing amateurs must welcome the new licensees and introduce them to a wide range of exciting and challenging activities. We will have our work cut out for us. My own specialty is the development of amateur radio computer networks (see Personal Background below). Several new amateurs have written me to say that my work in amateur TCP/IP

networking finally prompted them to become licensed. I take great pride in this, and I hope to succeed on a much larger scale with the help of the Communicator license.

Respectfully submitted,

Philip R. Karn, Jr., KA9Q

Personal Background

25. I am thirty-three years old, and have held an Extra Class amateur license since 1973. Professionally, I work in computer communications networking research for Bell Communications Research (Bellcore), the R&D consortium owned by the seven regional Bell companies. My formal education includes a BS in Electrical Engineering from Cornell University and a MS in Electrical Engineering (Computer Engineering) from Carnegie-Mellon University. My decision to pursue a technical career in communications had much to do with my exposure to amateur radio in high school.

26. Although I work professionally in the field, I retain a strong interest in advancing amateur radio technology. I am a member of the ARRL Ad Hoc Committee on Digital Communications. In 1982 I participated in the design of the AX.25 amateur packet radio protocol. I have been a technical volunteer for the Radio Amateur Satellite Corporation (AMSAT) since 1980, where I have specialized in orbital analysis, and I currently sit on their Board of Directors. I also sit on the Board of Tucson Amateur Packet Radio (TAPR), the group that brought packet radio to the Amateur Service in its present form.

27. I am the coordinator and primary author of the KA9Q Network Operating System (NOS), a computer software package that implements the AX.25 and NET/ROM amateur radio networking protocols and the US Department of Defense (DoD) Standard Internet Protocol Suite ("TCP/IP") on a variety of personal computers. This software, including full source code (about 50,000 lines), is available without charge to any amateur radio or educational user. I estimate that there are

at least 5,000 users of this software in several dozen countries. Although it was originally written for amateur packet radio, this software is also very popular with users of the National Science Foundation Research Internet (NSFNET). Some users have made significant contributions to the software even though they are not licensed amateurs. (I consider these people to be prime candidates for the Communicator license.) A significant performance enhancement I developed during my early experiments with TCP/IP on amateur packet radio was general enough to be made a required part of the TCP/IP specification. It is now used well beyond amateur radio.

28. I have written or co-authored over a dozen papers and articles on amateur packet radio and satellite topics that have appeared in the proceedings of the _A_M_S_A_T _S_a_t_e_l_l_i_t_e _S_y_m_p_o_s_i_u_m, the _A_R_R_L _C_o_m_p_u_t_e_r _N_e_t_w_o_r_k_i_n_g _C_o_n_f_e_r_e_n_c_e, the _I_E_E_E _J_o_u_r_n_a_l _o_n _S_e_l_e_c_t_e_d _A_r_e_a_s _i_n _C_o_m_m_u_n_i_c_a_t_i_o_n_s, and several other journals and magazines. I have given invited talks on and demonstrations of amateur packet radio and satellite technology to non-amateur technical audiences, including

INTEROP, a large trade convention devoted to computer internetworking, and various NSFNET groups, including the Internet Engineering Task Force (IETF, in which I participate professionally), and NORDUNET, the Scandinavian research computer network.

29. I have received awards and recognition for my work in amateur radio technology, including the AMSAT Technical Achievement Award in 1986, the Dayton Hamvention Special Achievement Award in 1989, and a "QST Profile" in the April 1990 issue of _Q_S_T.

I just bought a new Kenwood TS-940S. The manual says that the
fan on the heatsink on the back will hardly ever come on during "normal"
use. The manual further says that the fan will cycle on and off during
operation. My fan is off when I first power up the radio, but once it comes
on, it stays on. This occurs even if the transmitter is never used, and I stay
in receive mode. The heat sink itself stays warm, even with the fan running.
Is this *normal* ? I can't ever say that I've seen it cycle on and off.
Do I have a problem, or is this the way they all work?

Over the years of interacting with the female species I have attended many functions whose attendees were mainly female: craft shows, lectures, a local discussion group meeting, etc. They didn't even try to have anything that might have interested husbands/significant others. While the terminology used (ladies) may have been offensive (although I find being called gentleman more amusing than offensive), and the choice of activities may not have been very interesting to some (but given the average age of hams and their spouses I don't know), the fact that hamfests try to have alternative activities for those (usually female) people who are unfortunate to have to accompany their ham spousal-like unit (usually male) doesn't seem worthy of indignation to me.

By the way, are the terms "lady" and "girl" verboten or are their age ranges where their use is acceptable? At my company (mainly male engineers) we have become sensitized to not calling female co-workers girls, since we certainly wouldn't call each other boys, and I don't think anyone under the age of 50 calls anyone "lady", but some older women seem to like to be called girls and very young girls seem to like to be called ladies. I guess eventually all gender distinction in our language may disappear and the announcement at the ham fest will say:

ATTENTION, HUMANS, IN 5 MINUTES THE ALTERNATE ACTIVITIES FOR NON-RADIO NERDS WILL START IN ROOM 123. WELDING, OIRGAMI, ORIGAMI, MAKING LITTLE THINGS OUT OF STUFF YOU WOULD NORMALLY THROW AWAY, HUNTING, CONVERSING MEANINGFULLY, AND THE WET SOCK COMPETITION WILL BE HELD. FOR THE YOUNGER FAMILIAL UNITS, A NEW VIDEO ON THE DANGERS OF DWARF TOSSING (RECENTLY OUTLAWED IN NEW YORK) WILL BE FOLLOWED BY THE RELEASE OF HUNDREDS OF BIO-DEGRADABLE DIAPERS, WHICH CAN BE SAFELY EATEN BY SEA TURTLES.

Hmmmm, maybe all this will put a stop to the practice of DX stations saying: "The YL only, go ahead." My throat is still sore from the S2 operation.

LORAN-C receivers use "voltage probe" antennas (very high impedance, allowing them to be short). The whip is usually connected directly to a FET gate, perhaps protected by internal diodes, also a neon lamp to ground. They occasionally get knocked out by lightning. I have one on the back end of my car, and a 5/8-wave 2m antenna on the front, with 45 watts. That doesn't seem to bother the LORAN, but I don't think I would want to run 100 watts PEP HF six feet away.

My Micrologic ML-5000 LORAN receiver has given 8 years of very reliable service. I once visited th 400kW LORAN station in Indiana. A mile away, I turned off the receiver and unscrewed the antenna, just to be sure. (The receiver was then only 1 week old, so I was more paranoid than now. :-)

> structured?

I disagree. I think making contact with all points on the globe is a novel enough achievement that people will pursue it whether or not any recognition is involved. Worldwide communication is one of the gee-whiz aspects of amateur radio.

Furthermore, why does the DXCC program need justification? It's just a paper chase. If Wayne doesn't like it, he can start his own (I think he has.) In fact, anyone can have an awards program. I simply don't believe the DXCC program is the cause of poor operating practices.

> And before you answer, have you listened in on 20 on a regular
> basis, and thought what it would be like to be on the other end of some of
> these pileups EACH AND EVERY TIME you got on the air?

No I haven't thought what it would be like because this is not the way things work. My experience has shown that the station being called dictates (through his operating practice) 90% of the behavior of the stations calling (aka "the pack"). If the DX station makes a big deal out of himself, he will whip the pack into a frenzy. On the other hand, if the DX operator plays wanders up to 14345 and plays it low key, he can have a few nice conversations without being hounded by the pack.

Everyone seems to be tip-toeing around this, so maybe I'll address it directly: How about a "computer class"? This would be for everyone who wants to use radio as just a link between their computers and who would like to avoid the use of hard lines. The exams would exclude any kind of Morse Code and would have no analog technical questions. Maybe we could set it up so that it is "Amateur Computing Communications", completely separate from ham radio; with some band space of its own that excludes CW, AM, SSB, and FM or any other form of voice communication. It could even have its own counterpart to the ARRL: The ARCL. What about it?

> experienced yet... :-)

The key is in the rythm. With a hand key it becomes obvious;

   daahdi dahdahdahdahdaah dahdaah dididaahdit didahdaaah

The extended final dashes in a character along with the occasional
staccato dots are the characteristic of what was commonly known
as the "Lake Erie Swing". The "Bannana Boat Roll" tends to accent
the individual characters in a pattern similar to the poets iambic

meter. Both of these "swings" are much easier with a "sidewinder" or "sideswiper" key. These keys are constructed to be actuated with a horizontal motion, you form the dots manually as there is no vibrator element. Elements are formed (keyed) on alternating sides as opposed to the "VIBROPLEX" style "BUG" which forms dots on one side and you form the dashes on the other. Many OTs just clamped a hacksaw blade to a vertical support, wrapped friction tape on the free end and mounted a couple of screws to allow contact on either side of the blade. This is a fine way to do it but there is often too much flex in the arm of the key. A stiffer saw blade or some small angle stock attached to the length of the blade makes for a better feel. This type of key is excellent for mobile CW work; it is a more natural movement than that from a straight key and doesn't take the concentration of a "BUG" or an electronic keyer. For those of you who may wish to buy such a beast you might see if INSO Electronic Products is still in buisness. They are the successor to Bunnell and (in 1975) still had a stock of "Sidewinders". They are/were located on Long Island.

Like I said, try it neat, there's a lot of potential in that call.

73,
Ron K3FR

> >   I **DO** want them in MY backyard !!

I do not want them (communicators) on 2 meters, or any lower band for that matter. Maybe I did not make my initial message clear; 2 meters, like 20, IS in many areas of the country, a zoo, one that I would not like a newcommer to experiance. There is a lot of hype about 2 meters being "THE BAND". Why, because thats where most of the "OLD PHARTS" have invested in repeaters and ancilliary equipment. Yes, there are other activities on 144-148 but the weak signal types etc are pretty tollerant of problems and quickly jump to help solve them for the novice. (not required to be a Novice) There is just too much going on on 2 meters to let a horde of newcommers enter with little more in mind than bear reports and ratchet jawing. (Face it, you will get a good number of technical persons and a lot of those who really want to be HAMS but the number of CBers will far and away be the majority.) Keep the Communicators off 2 meters.

> >
> >And because of the fact that I live in a rural-like area, my backyard is
> >stuck at being 2 meters.

With an easier to obtain licence open to 220 voice you will gain a new backyard. If they can't get on 144-148 then if they want to talk they will use 220 which, for this purpose, is just as good.

>
> Ok Phil.. let's for a moment suppose that the Novice License is saved. Where
> THEN is the central meeting ground for ALL of HAM RADIO? Hint... Novices
> already have 220 privileges. We need to populate 220.... and it has

>
> and we also put links on it to 2 meters
> so that we had the OPTION to hook into it and talk to them, just like we
> all have the OPTION to operate Novices on the HF allocated areas. I
>

When are we ALL going to get over the stigma that Novices and Communicators are not HAMS? I may have been bad mouthing one segment of the proposed Communicator population but I have no intention of declaring them anything other than HAMS and treating those who wish to support and defend our precepts of creation as such.

> >> but just consider that for all practical purposes, there is NO difference
> >> between 146, 222 and 440. They are ALL relativly local in coverage
> >> (on average), they ALL have relativly simple equipment requirements
> >> and they ALL have resident hams within easy distance over most of the

>
> >About HALF of the country.
>
> And whose fault is that?
>

For the purposes that Communicators will use these frequencies: datacom, TV, experimenting and just plain communicating on a (relativly) local scale, these frequencies are, on AVERAGE, identical!!!

> >BUT if Communicators do NOT get on 2 meters, then you will be getting what
> >you say, because the Communicators in the rural areas will be getting NO
> >(usable) privileges.

Communicators in rural areas will have useable privileges by the fact that there will be other Communicators in the same rural areas, your point assumes that only a very small group of these people will appear in rural areas. After things have reached a stable state following the inception of the licence class then we should see more activity and a usable 220 band in rural areas.

>

>
> >Make a point, please.

I guess I shouldn't have been so metaphorical in my position on this one. What I was saying is: if you have a resource which is not in a viable posture and you wish to convert it to a model application you can do one of two things. First, you could tear it down, remove it from its current use immediately or, second, you could allow the current users to render it useless and then condemn the resource and take over by right of eminent domain. If you are smart, you even make a profit doing this and get acknowledged as a hero. Now what I am saying in context of amateur radio is this: either dismantel the entire service and get a black eye doing it or let the amateurs destroy the service and then take the frequencies and SELL them to broadcasters, cell-phone and other services. So, let's not chose a path which will be self destructive in the end, loose if we will, let's just put up a fight and make sure the villian is identified as someone else.

> >band, then the "Elmer" can also buy a new UHF radio to talk to him, or
> >leave him alone.
>
> EXACTLY! I like the last option. If elmer wants to help him he can buy
> a 220 Mhz radio and do so, or your repeater group can FUND a 220 repeater
> and help NOVICES too.

And, isn't this the true Ham Elmer spirit? When did you expect your kid to buy a car before you taught him how to drive? You taught him in your car or you got him to driving school.

Well, I guess I did generate a lot of bandwidth with that posting. I apologize for being so tangential in my initial statments. Remember, there is a difference between a novice and a Novice, they are not required to be the same person. Similarly, Novices and Communicators will all be HAMS, so let's treat them like HAMS. Teach them something and they may teach you something, if not technical then possibly behavorial.

I will be traveling to England some time in the next 8 weeks. Any info
on how long it takes to get a permit to operate in England takes?
Any info on licensing or frequencies would be appreciated. Len

What's with Derek Wills? Can't ladies be ladies? Can't they be recognized
as such? I see absolutely nothing chauvinistic in providing activities for
ladies who choose not to be Hams! No one is trying to keep lady Hams out
of the Ham activities, either, either as far as I can tell. Lighten up!
There ought to be room for everyone at the Austin Hamfest.

We are in the 20th century, Derek, so let's not forge into the 21st making
believe there is only one sex.

x-------------- CUT HERE --------------------------------------x

THE RADIO SHACK PRO-2006 PROGRAMMABLE SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-2006 is a 400 channel, wide coverage scanner radio, manufactured in Japan by General Research Electronics. It is the successor to the PRO-2005 and a grandchild of the PRO-2004, the super scanner which put Radio Shack out in front of its competition in the base station scanner market.[1]

The PRO-2006 is almost identical to the discontinued PRO-2005, with the exception that the PRO-2006 boasts HyperscanTM, a catchy way of saying that it scans fast -- about 26 channels/second versus the PRO-2005's 16 channels/second rate.[2] At about $400, the PRO-2006 is $20 cheaper than the PRO-2005 was. Both scanners are built using surface mount components and are housed in a gray plastic cabinet.

Frequency Coverage

The PRO-2006 covers 25-520 and 760-1300 MHz, except for 2 gaps in the cellular telephone bands. The two gaps in the 800 MHz range can be restored all the Radio Shack continuous coverage scanners by removing a diode. Diode D502 is the culprit in the PRO-2005 and PRO-2006.

A matrix of diodes, attached to the microprocessor's input port, is often used to configure radios for sale in different markets. The diode matrix on new the PRO-2006 is located on the vertical circuit board just behind the front panel. There are 2 diodes present, and holes drilled for 2 more.

Lots of Memory

---

1. "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

2. "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

The PRO-2006 has the usual features that scanner buffs have come to expect: individual channel lockouts, selectable 2 second rescan delay, an external speaker jack, etc. Casual scanner users don't need 400 channels, but scanner hobbyists can have those channels filled up in no time flat, especially with frequencies in the vast 225-400 MHz military air band, and other federal government allocations.

With so many channels to program, one dreads the thought of a power failure, which could clear memory in a hurry. Not to worry, the PRO-2006 memory is backed up by a conventional 9 volt alkaline battery (not supplied), which should be replaced every 6 months or so.

The 400 channels are divided into 10 banks of 40 channels each, and one can select or deselect any channel bank from the scan list. Individual channels can be locked out in the customary way, but the PRO-2006 maintains the handy feature introduced in the PRO-2004, a LOCKOUT REVIEW. Successive depressions of this key step through the locked out channels.

Scanners worth their keep have a priority feature, with channel 1 usually designated the priority channel. The PRO-2006 is more flexible; any of the 400 channels may be designated the priority channel. When the PRIORITY key is depressed, that channel will be sampled every 2 seconds, and the radio will stay there if a signal is heard.

The PRO-2006 has two scan speeds, which measured approximately 13 and 26 channels/second. While scanning at high speed, the PRO-2006 won't skip over weak signals like some of the AOR-2515 scanners do. Adding diode D501, situated at an unmarked location between D502 and D503 sped up the PRO-2005 scan and search rates by 25%. Adding the same diode in the PRO-2006 has no effect on the scan or search rates.

It has been claimed that a PRO-2005 could be made into a PRO-2006 by merely replacing the CPU clock crystal with one of a higher frequency. Don't believe it. Changing the PRO-2005 clock speed would affect both the rescan delay and the priority rate, and they would no longer be 2 seconds long, as they are in the PRO-2006.

When programming a channel, the PRO-2006 firmware sets the mode automatically, based on its idea of what mode is most prevalent on that frequency. This feature saves extra keystrokes, and makes one appreciate the thought that went into the design of this radio. The default mode can be overridden easily, if need be, like to listen to a military mid-air refueling operation in the 225-400 MHz range, which is mainly populated with AM signals.

Searching

The SEARCH facility found on most programmable scanners allows the entry of a pair of frequencies, then by pressing a key, the radio searches frequencies between those limits. The PRO-2006 allows for 10 pairs of limits! These pairs of limits are stored in their own memory, and don't use up any of the conventional 400 memory channels. One can set up several search pairs, for instance:

- 46.610 - 46.970 MHz: cordless telephones
- 144 - 148 MHz: the 2 meter ham band
- 418.625 - 418.900: Drug Enforcement Administration

Another unique feature of the better Radio Shack models is the MONITOR key, which stops the search and stores the frequency in one of ten special monitor memories. These memories are separate from the 400 main memory channels. The search can be restarted from where it left off by striking the up or down arrow key.

The user can select the search direction (up or down), and step size of 5, 12.5, or 50 kHz, although the PRO-2006 is intelligent enough to select a default step size based on the frequencies being searched. As on the PRO-2004 and PRO-2005, there is a hidden step size of 30 kHz, but this step size is only used in the cellular phone band after restoring full 800 MHz coverage.

The selected parameters are displayed on the LCD panel, smaller than the panel in the PRO-2004.

The DIRECT key allows one to start searching up or down from whatever frequency is on the display. Let's say the scanner is in MANUAL mode, and set at channel 26, which contains 460.100 MHz. Striking the DIRECT then UP-ARROW keys starts the PRO-2006 searching upwards from 460.100. This is a nice feature.

The PRO-2006 contains a "window detector" circuit, which is called into play during a SEARCH operation. This circuit tries to detect when the radio is tuned close to the center frequency of a station, and prevents the search from halting prematurely, off to the side of the signal.

The AFC (automatic frequency control) circuit of the Bearcat 800XLT often causes a search of 850 MHz signals to halt prematurely. Even though the signal sounds on frequency, the display reads the wrong frequency. Neither the PRO-2004 nor the PRO-2006 have this problem.

The PRO-2006 includes a SOUND SQUELCH, resembling the VSC circuit on the ICOM R-7000, which may be used during scan or search operations. With the the sound squelch enabled, signified by a red lamp above the pushbutton, the scanner will skip over unmodulated signals. This is handy for skipping over "birdies", link signals with a constant carrier, or baby monitors when baby is asleep.

The manual warns that the sound squelch may be fooled by signals with low modulation, and skip over them. The PRO-2006 SOUND SQUELCH tries to detect the presence or absence of modulation (not human speech), so unfortunately, it thinks that noisy dead carriers, digital data signals, and paging tones are worth monitoring and will stop the scanner to listen to them.

Taping Facility

A tape recorder can be connected to the TAPE phono jack on the rear panel, which provides 600 mV of audio at a 10,000 ohm impedance. An audio filtering circuit rolls off the high frequency components before they reach the TAPE jack, which makes it impossible to use it for picking off FM subcarrier signals. In addition to a rear mounted external speaker jack, there is a miniature headphone jack on the front of the scanner.

The PRO-2006 lacks a COR (carrier operated relay) output, like ICOM R7000 and older Bearcat 300 have, which would be useful for actuating a tape recorder.

Basic Performance

To evaluate sensitivity, the PRO-2006 was compared with it's grandfather, the PRO-2004. Since a signal generator was not used, quantitative measurements could not be made. Instead, an Antenna Specialists AV-801 antenna was switched between radios, signals from stations were compared by ear, and the results tabulated.

Simply put, the PRO-2006 proved more sensitive than the PRO-2004 on all bands tested, and much more sensitive in the 850 MHz range. The earlier PRO-2005 was also more sensitive

than the PRO-2004, but both the PRO-2005 the PRO-2006 let 800 MHz trunked systems and cellular telephone conversations bleed through while searching the 118 - 132 MHz commercial aircraft band. The 800 MHz interference was heard on the 2005 and PRO-2006, not the 2004.

Although the PRO-2004, PRO-2005, and PRO-2006 can suffer the effects of intermodulation, they are much more immune than the overly sensitive, image laden Bearcat 800XLT. Intermodulation from paging appeared on several frequencies above 1000 MHz, in a region not many people monitor. Oddly, audio from television channel 50 was heard on 1251.625 MHz. The

PRO-2006 has a 10 dB attenuator, operable by a slide switch on the rear. The attenuator helps eliminate intermod, but few people would want the attenuator enabled while scanning or searching as it degrades both wanted and unwanted signals. A programmable attenuator feature, selectable for each channel, would have been a better idea.

The up conversion design of both the ICOM R-7000 and Radio Shack PRO-2006 allows use of a very high IF (intermediate frequency), which helps avoid image problems.

The audio output quality is good, although the top mounted speaker directs the sound at the ceiling, but adding an optional external speaker allows the sound to be directed at the user's head.

Unfortunately, the audio level of AM signals is somewhat below that of NBFM signals, requiring a slightly different setting of the volume control, although this has improved over the PRO-2005. When scanning both AM and NBFM modes, one has to find a compromise position of the volume control.

The PRO-2006 squelch control has a small amount of hysteresis, an improvement over its GRE ancestors. Too much hysteresis is like having too much play in a car's steering wheel, or backlash in a gear set. This hysteresis forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching.

Mechanical and Electrical Construction

The newest scanners use tiny surface mount components, which permits manufacturers to cram more circuitry into smaller cabinets. This technology makes home repair and circuit modification almost impossible. The "lick and stick" parts are so small it's are difficult to tell a surface mount resistor from a capacitor, and components are rarely marked with their values.

The PRO-2006 is smaller and lighter than the 2004. It is enclosed in a gray plastic cabinet, with a plastic front panel. If one is going to pay $400, one deserves to own some metal, but several stages are internally shielded in their own metal compartments. The entirely plastic cabinet of the older PRO2003 allowed wideband noise to radiate out of the scanner and into nearby shortwave receivers.

The PRO-2006 vertical front panel is an advancement over the sloping panel of the 2004. You can stack the scanner on top of other equipment and see the controls without standing up. If sitting directly on a table, two hinged plastic feet, padded with rubber bumpers, can fold out from under the front of the radio to tilt it at a good viewing angle.

There is a single BNC antenna connector on the rear of the PRO-2006, and the radio is supplied with telescoping antenna which screws in through a hole in the top of the cabinet.

Internal construction is excellent, and the internal shielding is commendable. Interstage shielding is very important in a wide band receiver, to prevent it from "hearing itself", an undesirable phenomena which results in birdies. The PRO-2006 owner's manual lists dozens of birdie frequencies. The shielding is much better in the PRO-2006 than in the 800XLT, which uses no shielding around the 800 MHz converter stage, and probably accounts for some of the birdies in the Bearcat.

Frequencies and other indicators are displayed on a backlit LCD (liquid crystal display) panel, and the level of backlighting can be dimmed by a pushbutton switch. As with the PRO-2005, the poor contrast on the small LCD panel makes it difficult to read a frequency more than just a few feet away, and is nowhere near as good as the greenish blue fluorescent display in the old Bearcat 300.

However, physically challenged and vision impaired scanner buffs will appreciate the conventional raised rubber keyboard in the PRO-2006, Only moderate pressure is required for actuation, and key depressions are confirmed by a mild "beep" audio tone.

The PRO-2006 is the right size to fit under the dashboard of intermediate sized cars, but there are few concessions to those wanting to use this scanner in a vehicle. Perhaps

Radio Shack has been influenced by repressive laws restricting mobile scanners in a minority of states, like New Jersey.

Although it can be operated on 12 VDC, neither a mobile power cord nor mounting bracket are provided. These items were included with earlier, pre-PRO-2004 Radio Shack models. The AC power cord is not detachable, and would have to be bundled up to keep it out of the way in a mobile installation.

Owner's Manual

The user manual is much better than the fold out sheet furnished with Uniden scanner.

A single page frequency allocations chart is included, but is very general. Trunked radio systems are mentioned, but only briefly. Most people buying PRO-2006s probably have other scanners and so will be somewhat familiar with scanning.

The up conversion design of the Radio Shack PRO-2004/5/6 allows use of a very high IF (intermediate frequency), which all but eliminates image problems. Ironically, the PRO-2006 owner's manual contains a section on images. This section appears in the manuals for most other Radio Shack models, and was thoughtlessly included in the PRO-2006 manual. It babbles on about images being 21.4 MHz away from the real frequency -- true for simpler models, but not so for the PRO-2006.

There is no schematic. Thankfully, detailed service manuals for Radio Shack scanners are usually available for $12.00 or so.

The PRO-2006 is warranted for 1 year, which is reassuring.

What's Missing?

So with all these neat features, what's missing from the PRO-2006? It would have been better to have more channel banks with fewer channels in each bank, say 20 banks of 20 channels. A "search and store" mode, like that on the ICOM R7000 and older Bearcat 250 would have been nice, and such a circuit is being marketed by Key Research. A lighted keyboard and a signal strength meter would also be welcome, as would a mobile mounting bracket and SCA output jack.

A frequency query facility, as found in the Uniden 200XLT, would have been very useful to finding in what memory channel a given frequency is stored.3 Mega-channel scanners

really need this feature and it would have been trivial to implement in the PRO-2006 firmware.

Summary - It's Tops

If all one wants is a scanner to monitor local police and fire, there are certainly cheaper and simpler models than the PRO-2006. This scanner is the best base/mobile scanner available at time of writing. AOR's AR-2515 has more channels, but its buggy firmware and tendency to skip active channels prevent it from taking top honors. At about $400, the PRO-2006 scans much better than the ICOM R7000, a great VHF/UHF communications receiver, priced at over $1000.

The PRO-2006 has the right features and performance, especially for scanning the wide 225-400 MHz military aircraft band and the newer federal law enforcement radio systems with their dozens of channels.

Actually, in the Pacificon announcement, the activity "for the
```

spouses" on Saturday is a shopping safari to San Francisco (from San Jose). Quotes from the flyer "Most of these stores seem to aim at the ladies, but there is shopping for men also."
"This is a repeat from last year by request of many of the gals"

BTW, Pacificon '90 is in San Jose on October 10-12.

>the Establishment of a Codeless       )
>Class of Amateur Operator License     )
```

My letter to the FCC was text set for a laser printer and is not easily posted (unless you read PostScript :-). The following are the pertinent paragraphs,

"... the author would like to express his sincere appreciation for, and his complete support of, the Commission's attempt to introduce a codeless class of Amateur Radio operator license.

"The author would, however, like to suggest that the new class of operators be given as many priviledges as the International regulations would allow.

"Specifically, if the codeless class were to be administered examinations on theory and rules and regulations commensurate to that administered to the Technician class operators, then there is little just reason why they should not be accorded the same rights and priviledges as a Technician class licensee

> in the Radio spectrum above 30 MHz.
>
> "Further, the author would like to encourage the Commission to eliminate the separate classes of Amateur Radio licenses and perhaps reduce it to simply two classes -- a Codeless (above-30 MHz operations only) and a Code-proficient class (operations in all Amateur Radio bands), with the aim at consolidating to a single class of Amateur Radio operators when International regulations no longer requires Morse code proficiency."

End quote.

Flames to /dev/null or to the FCC, please.

What in the hell do the last 6 articles titled "Re: More ICOM IC-R1 Review" have in common?

Answer: Nothing to do with ICOM, scanners, the IC-R1 model, any of the problems or features of the IC-R1 unit, opinions, etc.....

Please title articles the same way the ingredient lists are drafted on most food products; whatever the most important(highest phyiscal content) first.

This thread should be:
  1) moved to another newsgroup
  2) retitled
  3) referenced to all of the BS published less than three months ago
      in this newgroup (again the wrong place!!!)
  4) ignored

Practice your usefulness and don't follow someone else's poor example with an even stupid'er act.

Don--

Actually, I did consider that. I just didn't mention it in my posting because I didn't want to dilute the main discussion about the apallingly narrow range of activities for the group that makes up the bulk of non-hams at ham conventions: namely, women.

I guess I assume that men attending ham conventions will be interested in going to the forums even if they aren't hams. Is that a sexist assumption? :-)

As for Doug Faunt's posting about Pacificon, yes, I saw that and noted that the "shopping safari" will be visiting outlets for men's clothing as well as women's. But Doug, would you like to place a bet on whether any men will actually join the shopping trip? :-) I sure doubt it...

But the hours that it takes to learn it won't! When I took the time to learn the code, my wife was NOT happy. Not only that, she HATES even hearing the code. Even a short repeater ID out of the handie almost always results in a comment of "You're beeping again...".

The only way I can operate code in my house is to either use headphones or just plug the audio into the pk232 and not even listen to it.

Gee, in a matter of days I'm now a "mysterious person"... :*<
Please see my finger.pln for complete address, phone number, and office hours..
No, I'm not in the Cornell area -- that's just how the mailer handles routing.
Actually, I live in Central Pennsylvania, and if I were to rely on you guys for delivery of messages, you'd still be looking for me in the wrong State, having missed me by a couple hundred miles, give or take a few... :*<

So, if I *don't* hear from you about my relative in SF, it could mean that:

1. you don't have any information about her
2. she is dead, but you chose not to pass the info along :*<
3. you can't find me

As for becoming a ham... I might... and I might even be able to convince my cousin in SF... but, Old Auntie from across the bay...? Nah, don't think so.
However, if I were to use my ham license to get a personal message across, wouldn't I be breaking the law? Wouldn't that be "circumventing a commercial carrier"...? (Assuming, of course, that a commercial carrier were operational)
(Which has neither been proved or disproved)
(Which would require a bit more scientific approach to prove/disprove)
(Which can be a waste of time, since we'll always mix emotions with facts)
(Which is a shame, but then again, we're only humans... :*>)

Oh, the "free" service...
I'm kind of tired of hearing about a free service that:

1. I'm paying for.
   Once again: there may be no out-of-pocket monetary transaction at the time the service is rendered, but that's too limited an interpretation of "free", in my opinion.
   If a valuable limited commodity were not given to you for FREE (how do you like that word now?), it could help reduce my phone bill, hence I'm paying for your hobby through my phone bill. Come an emergency, you're doing nothing, at best, but PAY BACK in the form of public service for an exclusive privilege extended to you during normal times. I'll admit that the concept is a bit more complex than that, but the *spirit* if not the *letter* of this simple concept has not been disproved yet.
   If it were, we'd have to conclude that there may indeed be a FREE LUNCH.
   Of course the industry would have to pay for new frequency allocations,

but its customer base would also expand, and the *fixed* cost of some items (towers) would now be divided by a greater number of customers, eventually bringing costs down for everybody.
In any case, be it what it be, whenever the support base of any commercial enterprise has been allowed to expand, costs have come down.

2. has a reliability level which is dubious to say the least.
   More than ever now, I will stick to knowing that my relative is ok when I *hear* her voice. (Go ahead, start laughing as I dial the number...)
   Of course, there is always the PROFIT question... gee, and I thought that was a *plus*... That tells me that the phone company will do all they can to allow my call to go through... if it doesn't, they don't collect. It's not in their best interest that I get a busy signal.
   We've heard both extremes on this forum (phones were the first to collapse... phones never failed...) and it doesn't really matter how many more will add their personal experiences. What I know is that I will stop short of nothing in order to hear her voice. I'm more than willing to pay for the use of your equipment and your time, but you got to find me first, then hand me the mike... deal?

3. can only be used in case of EMERGENCY.
   Emergency - "an unforeseen combination of circumstances or the resulting state that calls for immediate action."
   (Webster's New Collegiate Dictionary, 1977.)
   Unforeseen...? An earthquake in California, UNFORESEEN...???
   A hurricane on the East Coast, UNFORESEEN...???
   Come on, we may not know exactly where and when, but those events are sure as h*ll to occur sooner or later... and with that degree of predictability and a little planning... oh well...
   Now, if we were talking about WW3... :*< :*< :*< :*< :*< :*< :*< :*<

-P. Bandini

Quite right. I'm in San Diego. The co-ordination group here in SoCal
(SCRBBA) won't even respond to my request for co-ordination (RFC's). And
quite naturally, the current trustees of UHF repeaters don't want any data
published about their boxes. Check out the ARRL repeater directories over the
last few years. All very secret. SCRBBA will stack open machines 3 and 4
deep in SoCal but those with stroke (like SCRBBA insiders) have clear channel
boxes that only burp ocassionally. If it hadn't been for the 220 grab, you
would only see a half a dozen open UHF repeaters listed.   Just tain't fair.
Kinda like professional politicians...

CW is absolutely NOT relevant to any non-CW operation so therefore a test
in it is just as irrelevant at any speed.

You happen to be interested in CW, and for you, it is a viable means of

communication. But I happen to NOT be interested in it and won't be
using it. I plan to work weak signal SSB soon, and do so NOW with FM
(yes, there is some of that, too).

And of course these are the people we need to remove from amateur
radio as soon as possible, repeater and all.

There is also the concept of HARMFUL interference.

And the FCC policy applies to UNcoordinated repeaters vs coordinated
repeaters. If you KNOW a repeater is on the frequency when you use
its input or output for simplex, the situation is identical. It may
or may not be a violation. I will have to think about that a while,
but if you KNOW its there, you know its there.

I have SM315.ZIP available on my landline BBS. That is the latest verison
that I am aware of. You can download this file by calling 317 882 9330 and
logging in as Ham Radio, use YAGI for the password.

If you can file request via Fidonet, file request SM315.ZIP from node
1:231/30, I support 12 thru 9600 HST speeds.

the Establishment of a Codeless   )
Class of Amateur Operator License )         Submitted:  23 July 1990
```

COMMENTS BY ROBERT J. CARPENTER, OF ROCKVILLE, MD.

MAJOR POINTS

1. There are flaws in the assumptions which have led the Commission to propose a no-code Communicator license class, and thus I oppose its creation. There are very strong reasons for retention of the Technician license. The Commission should cease issuing the General class license, since it differs little from the Advanced class and thus is a needless administrative burden. The Novice license should be retained, but in a five-year, non-renewable form. Finally, I point out serious flaws in the Communicator-with-Code concept, and offer suggestions on bands where the Communicator class should not be permitted, if it is established against my advice.

QUALIFICATIONS

2. I, Robert J. Carpenter, of 12708 Circle Drive, Rockville, MD 20850, have been a licensed amateur (W3OTC) since 1948, and holder of a Class A (now Advanced) class license since 1949. I am a graduate electrical engineer and have done engineering design work in the development of VHF/UHF ground-to-air digital communications (1951-53),

radar map matching navigation (1953-55), VHF meteor-burst data communications systems (1955-59), portable atomic frequency standards (1959-63), VLF digital receivers and spherics direction finders (1970-75), local area computer packet networks (1975-84), and multiprocessor computer performance measurement (1984-90), including the detailed design of semicustom VLSI integrated circuits (1989-90). I was chief engineer of the first FM-stereo broadcasting station in the Washington, DC, area (WHFS), prepared the FCC application, built the transmitter, got it FCC-accepted, built the audio console, etc.

3. I have operated on all amateur radio bands from 3.5 to 450 MHz (except the "WARC" bands), using many operating modes. I specialize in VHF and UHF, particularly the 50 MHz band using SSB and CW. I assembled a 146-MHz FM repeater for AMSAT in the Washington, DC, area, and maintained it for a few years (1972-5). I was one end of the first amateur packet radio contact by meteor burst on the 50 MHz band. I have had confirmed contacts with all 50 states and 6 continents on the 50 MHz band, and have communicated with over 69 countries on that band.

NO NEW LICENSE CLASSES NEEDED

4. As explained below, there is no evidence that the present minimal amateur code proficiency requirement has significantly reduced the number of highly technical individuals in amateur radio. To the contrary, most highly-technical amateurs hold high-code-speed licenses. Thus I see no need for a no-code license to attract technical persons. A no-code license will not attract the technical person who now uses the present code proficiency requirement as an excuse for not having an amateur license, when the real reason is lack of interest or lazyness. Given that a Communicator class will have essentially the same technical exam as the present Technician class, I fail to see how the Communicator class can attract non-technical persons to amateur radio.

Sorted by Amateurs per Capita   Sorted by Density of Stations

Amateurs per Thousand Population	Country or State	Country or State	Amateur Stations /sq mi	Total Population /sq mi
12.*	Japan	Japan	6.5*	844
2.4	California	New Jersey	1.667	985

0.25	France	Canada	0.006	6

Table 1 - International Amateur Data

* Since Japanese operator licenses never expire, this number is a count of all licenses issued, not a count of currently-active amateurs. For example the 1990 International Call Book lists 34,344 Japanese amateurs, a far cry from the claimed "one million". About 80% are no-code licensees who can operate all modes, 10 W, all bands except 10 and 14 MHz. Japanese amateurs and this factor is reflected in these computations.

5. The accompanying Table 1 illustrates that only in Japan, Denmark and New Zealand do a larger portion of the population hold amateur license than in the U.S. It appears that the vast majority of Japanese "radio amateurs" are, in fact, essentially Citizens' Band operators - and are not even in the International Call Book listing of amateurs. This, even though Japan allows no-code licensees on the long distance propagation bands below 30 MHz in contravention of international conventions. The United States is already nearly at the top among nations in per-capita incidence of radio amateurs. Many of our states have amateur population densities exceeding those of similarly-sized European countries. What percentage of the general population should be radio amateurs?

6. I see no justification for a no-code license, since our present experience (see below) shows that highly-technical people are not put off by a minimal code requirement, and any reasonable technical exam will deter people who have no technical interest in radio. Table 1 shows the U.S. to have among the highest incidences of radio amateurs, yet most of the other countries in the Table have no-code VHF/UHF licenses. This Table indicates that foreign no-code licenses haven't resulted in an incidence of radio amateurs higher than that we already enjoy in the U.S. A possible exception is Japan, which I consider not really comparable because of the perpetual operator's license. The only sure way of increasing these numbers is to debase the licensing requirements.

CODE NOT DISCOURAGING TO HIGHLY-TECHNICAL PERSONS

7. Some say that the code requirement discourages highly technical people from becoming radio amateurs. With this in mind, I have looked into the license class of the people who are active in technically-advanced aspects of amateur radio. I used three sources: a listing of packet-radio activities in QEX newsletter (from the American Radio Relay League), all U.S. amateurs mentioned in the March 1990 issue of the Radio Amateur Satellite Corp. (AMSAT) "Journal", and all "tenth call area" (W0) members of the Central States VHF Society (CSVHF - advanced VHF, UHF, and microwave enthusiasts).

Activity	License Class				
	Extra	Adv.	Gen.	Tech.	Novice
Satellites	15	14	0	0	0
Packet radio	6	6	1	4	0
VHF & Microwave	48	39	15	16	0

Table 2 - License Class Among Interest Groups

While only about 57% of the total U.S. amateur radio population hold 13 or 20 word-per-minute licenses, 100% of the amateurs mentioned in amateur satellite design, construction, and operation held high-code-speed licenses. In packet radio, the activity generally thought to be most interesting to younger "digitally-oriented" amateurs, I find that 76% of those mentioned hold licenses requiring 13 or 20 word-per-minute code. Over 86% of the VHF/UHF/microwave experimenters and operators in CSVHF held licenses requiring 13- or 20-wpm code. This data shows no evidence that a CW requirement has discouraged technical people from becoming radio amateurs. To the contrary, ALMOST ALL OF THE PEOPLE IN HIGHLY-TECHNICAL ASPECTS OF AMATEUR RADIO HOLD 13- or 20-WPM LICENSES. This refutes a major argument for a code-free license class.

CODE PROFICIENCY FUNDAMENTAL TO BAND-SHARING

8. Radio amateurs share their frequencies among many modes of operation, an important one being radiotelegraph code. For this sharing to work, all amateurs must have some knowledge of the code to be able to comprehend the activity of the other amateurs sharing the band. The Commission will receive other Comments pointing out the importance of code in emergency and VHF/UHF weak-signal situations. The fundamental requirement is that all amateurs have at least a minimum code proficiency so that these and other code activities can take place without unknowing interference from no-code amateurs sharing the same bands.

CONTINUE ISSUING TECHNICIAN CLASS LICENSES

9. I urge that the Technician license continue to be issued, and that Technician operating privileges be expanded to allow operation on (a) additional HF CW frequencies - about 40% of the HF CW bands, (b) all amateur frequencies and modes above 28 MHz. Technicians should be limited to a power of 200 watts below 30 MHz. Thus the Technician class will be recognized as a transitional class with full VHF-and-up privileges, moderate-power all- mode privileges on the 28-MHz band, and substantial moderate-power CW privileges on most of the HF bands. In many respects its privileges would be similar to those of the old Class B license. THE TECHNICIAN CLASS SHOULD BE A VALUABLE "ALL-BAND" LICENSE.

10. I oppose the creation of a no-code Communicator license class. However, if the Commission choses to create such a class, the solution to the problem of Communicator-with-code, set forth below, is to retain the Technician class of license. The requirements of any possible Communicator written examination should be same as for Technicians. Technicians are, of course, required to take element 1A, code at 5 wpm. The FCC's proposal for Communicator-with-Code specifically mentions the continued use of test element 1A. If the Communicator-with-Code has taken all the examination elements appropriate for a Technician license, why not issue the Tech? The Technician class recognizes the considerable use of CW on the bands below 220 MHz, and the international CW requirement below 30 MHz.

ISSUE NO NEW GENERAL-CLASS LICENSES

11. The Commission has proposed phasing out the Technician and Novice classes, which I think is an error. This drastic proposal has caused me to examine other license classes. General and Advanced classes have the same code requirement and they differ by only a written examination designed to ensure more adequate technical knowledge. I feel that the General-class technical requirements are not adequate for full-power HF operation. The General class appears to exist primarily as the result of the grandfathering of the old Class B license to General, and Class A to Advanced, at a time when equipment was much simpler than today, and when the bands were much less crowded. The Class B license had radiotelephone privileges only on the 160- and 10, 6, 2 meter and up bands. If I remember correctly, 40-meter phone and 15 meters were added after the change to General class. These restrictions are similar to the current Technician license. The Technician class allows HF code operation, (which I suggest be

broadened) which was not foreseen when both the General and Advanced classes were created. The Technician class already fills the place of the former Class B license. I do not believe that anyone can show that the differences between the present Advanced and General classes can justify the expense and administrative burden of continuing to issue both of them. I propose that no new General-class licenses be issued, but that present General licenses be renewable indefinitely. Future applicants desiring more than 200 watts on HF, and other HF operating privileges beyond the Technician level, would have to demonstrate the technical knowledge required of Advanced-class amateurs.

NOVICE LICENSES RETAINED WITH A SINGLE FIVE YEAR TERM

12. The Novice license should be retained as an entry route, primarily for the very young and old. However, it should be non-renewable. It was created to allow an easy entry to amateur radio through CW with on-the-air learning, an admirable goal. There must be some minimum knowledge level for competent operation of the highly- complex ALL-MODE amateur equipment of today. The Novice exam does not require this minimum level. Thus I propose that the Novice license be restricted to CW operation, and that all Novice licenses expire after a single five-year term. This is enough time to allow the Novice to learn enough to obtain a higher-class license. I also propose that Novice license exams be administered under the Volunteer Examiner (VE) system, so that Novices can be given CW (element 1A) and Radio Regulations credit toward all the higher-class licenses. Volunteer examiners are allowed to collect a fee to cover expenses, there are many examples of this being waived. I am sure that the fee will be waived for the participants in many of the license-preparation classes, and should thus not be a burden to the young. In any case the fee is roughly the same as the cost of a movie ticket or two. The Technician technical exam should not pose a problem to anyone 12 years old who is seriously interested in amateur radio. A person could be licensed as a Novice as young as 7 and still reach the 12-year-old educational level before a five-year Novice license expired. I considered a ten-year expiration, but feel the five-year period is adequate and provides a more immediate incentive for self-improvement.

TECHNICIAN CLASS SOLVES COMMUNICATOR-WITH-CODE PROBLEM

13. The Commission notes that its automated license processing system can handle only ONE additional class of amateur license, then it actually proposes TWO additional classes, Communicator-without-Code and Communicator-with-Code. These are disguised as one class, but the holder must use a callsign suffix when using the additional operating

privileges, even though FCC proposes the same privileges as the to-be-phased-out Technician class. How does the Commission propose to fit these two variations of the Communicator class in the single "slot" in its licensing system? In order for amateur radio's self-policing to be effective, the FCC's amateur licensee database (which supplies license-class information to the Callbook) must reflect the -with-Code and -without-Code status for each Communicator licensee.

14. A much better solution than suffixes and two versions of the Communicator class is to retain the Technician class of license. I believe the requirements of any Communicator written exam should be the same as the Technician exam. The FCC's proposal for Communicator-with-Code specifically mentions the continued use of test element 1A. If the Communicator-with-Code has taken all the examination elements appropriate for a Technician license, why not issue the Technician license? I contend that retaining the Technician class is much simpler and more straightforward than having sub-classes within the Communicator class.

COMMUNICATORS, IF CREATED, SHOULD OPERATE ABOVE 220 MHz

15. Should the Commission create a Communicator class, I urge that it be limited to frequencies above 220 MHz. No-code operation on bands below 30 MHz would be unworkable. Communicators operating below 30 MHz would have international effect - even if they communicated only with US stations, they would interfere worldwide. Long distance radio wave propagation is a natural phenomena not subject to modification by Federal regulation. I am a strong supporter of increased use of higher-VHF and UHF amateur allocations, and feel official promotion of greatly increased use of busy low-VHF bands (by Communicators) would be extremely short-sighted. Communicators, if required to operate above 220 MHz, would NOT be in a backwater of amateur radio. The 420-450 MHz amateur band is already used by enough experienced amateurs to ensure continual contact between Communicators and existing experienced amateurs. I am convinced that present amateurs having Communicator spouses or friends would become active on the higher bands. If the Commission makes its allocation decisions based on perpetuating lowest-common-denominator operating habits, rather than urging increased use of the thoroughly-practical higher bands, it will be doing amateur radio a great disservice. The Commission may receive comments noting limited present activity, even on the 430-450 MHz band, in places like Wolf Point, Montana, or even Houghton, Michigan (which is well north of the population center of Canada). It should also note that these are very sparsely populated areas, unlikely contain many amateurs, new or old. The September, 1989, FCC

amateur data base showed 25 amateurs in Houghton (pop. 7,500), which is about 70 miles from the nearest larger town (Marquette).

16. Nearly every mode of radio propagation occurs on the 6-meter band. The "weak-signal" amateurs in the lower end of the band have become expert in the practical aspects of these many modes, a valuable educational aspect of amateur radio. This band is the amateur band best-suited to meteor-burst communication, which is becoming more common as the necessary computers become part of amateur stations. A number of 50 MHz stations communicate by ionospheric scatter on a very reliable and regular basis. These and other modes employ very weak signals and sensitive receivers, often require use of CW, and their users value the cooperation of the amateur community that operates at the low end of the band. This operation is entirely incompatible with the normal big-signal FM and packet operation which predominates on most parts of the VHF and UHF bands, and which would doubtless attract the vast majority of the Communicators.

17. The upper part of the 6-meter band is adjacent to TV channel 2. Even the best TV set can't reject strong nearby signals in the upper part of the 6-meter band. The Commission is asking for trouble if it encourages widespread use of the upper portion of the 6-meter band by numerous 200-watt Communicator stations in residential areas. Channel-2 TV stations also have substantial (but legal) lower sideband output within the upper part of the 6-m band, which makes that portion useless for weak-signal amateur use. Many of the weak-signal modes require use of the full legal amateur power.

18. An operating privilege once given (Communicators on 6 m and 2 meters) is very hard to take away; thus some initial conservatism is in order.

SIMPLIFIED EXAMINATION SEQUENCE

19. My suggested licensing structure allows a simplified examination structure, as follows:

Class	Code Exam	Written Exam
Extra*	20 wpm	Same as Advanced plus Extra theory
Advanced	13 wpm	Same as Technician plus advanced HF theory
General		NO NEW GENERAL-CLASS LICENSES SHOULD BE ISSUED
Technician	5 wpm	Same as Novice plus VHF, UHF and intermediate HF theory
Novice	5 wpm	Regulations plus simplified HF theory
If the Communicator class is created against my advice:		
Communicator	none	Same as Technician

Table 3 - Suggested Examination Constituents

* Though not germane to the present proceeding, I feel that the Commission should phase out the Amateur Extra class. The reserved Extra-class subbands are used primarily to contact foreign amateurs who have not passed a 20-wpm code exam, thus there seems little justification for the 20-wpm requirement for US amateurs on these subbands. I am sure that the Volunteer Examiner system can establish some sort of accreditation for its code examiners to substitute for the Extra-class requirements.

CLASS-CHANGE SUFFIXES USELESS

20. I am disappointed that the Commission persists in pursuit of "administrative neatness" by having recently-upgraded stations use a distinctive suffix when using the new privileges. For example, the FCC proposes to require the PERMANENT use of a suffix when Communicator-class licensees use Technician-class privileges. There are two major problems: (1) the perpetual use of the suffix is unwieldy, and (2) the suffix serves no useful enforcement or administrative purpose, as shown below:

Enforcement Station Responses

Situation	FCC Requires Suffix	No Suffix Required
Use of Higher Privilege without Authorization	Must look up in listing to see if upgrade issued.	Must look up in listing to see if upgrade issued.
Use of Higher Privilege with Authorization	Operation is legal	Operation is legal

Table 4 - Upgrade Suffixes Useless for Enforcement

The listing of upgraded stations can never be up-to-date because of inherent processing delays. Why, then, require use of an unwieldy "upgrade" suffix? It would be a particular impediment on CW on the HF bands, where it would be permanently required for Communicators unless the FCC adopts my suggestion to continue to issue Technician licenses.

SUMMARY

21. The General class represents an unjustifiable processing burden, and is inadequate for full-power HF operation, and should be phased out. The Technician class is important as a transitional class with full VHF-and-up privileges, while offering substantial, limited-power HF

privileges. The Technician written exam is within the grasp of anyone who has mastered the technical skills necessary to operate the full range of modes possible with modern amateur radio equipment. The Novice license should be non-renewable. It should be limited to CW operation, since its technical testing is inadequate to demonstrate the capability to operate complex multimode equipment.

22. The proposed no-code Communicator class of license is a mistaken attempt to increase the quantity of radio amateurs by eliminating the fundamental common knowledge of CW - necessary for effective band-sharing. However, should the Communicator class be created, it should be limited to the thoroughly-practical-but-lightly-used frequencies above 220 MHz, and its written exam should be the same as that for the Technician class. Then there would be no need for the Communicator-with-Code confusion.

23. We cannot afford a proliferation of different classes and endorsements with infinitesimal differences and a special test for each. As mentioned above, I feel that the Commission should phase out the Extra class. Following my suggestions, the FCC would have a reduced number of classes being newly-licensed:

Extra*, Advanced, Technician, Novice.

* The Commission should initiate proceedings to cease issuing the Amateur Extra class license. The General Class should also be phased out, as mentioned above.

Respectfully submitted,

Robert J. Carpenter

Were I to do weak-signal work, I'd use a properly-designed and

easily-built digital signal processing receiver. Such can receive and
decipher signals so far down in the noise that you couldn't even tell
there was a CW signal there.

The supposed advantage of CW for weak-signal work is an illusion with
recent technology.

]In article <2814@anasaz.UUCP> john@anasaz.UUCP (John Moore) writes:
]>There is a significant difference between the computer on Usenet and
]>a repeater. The computer does not tie up any significant natural resource.
]>The repeater does: its frequency pair. Here in Arizona its frequently hard
]>to coordinate frequency for an open repeater, simply because closed
]>systems already control the frequencies for an area. I think this
]>is completely wrong, and an abuse of the public trust. I am opposed
]>to the coordination of ANY closed repeater. Sure... put up a repeater
]>and close it. But don't expect it to have any claim on either the
]>input or output frequency! If I want to carry on a simplex conversation
]>on the input frequency, using the repeater's PL, that is my right!
]
]Unfortunately it is not your right, the FCC calls it intentional
]interference if there is a conversation going on thru the repeater
]at the time. It has always been considered bad amateur practice
Interference is interference. It has not relevance to this discussion.
In other words, no matter what frequency I operate on, if I cause
interference INTENTIONALLY, it is "malicious interference" and is
against the law.
]to operate simplex on a repeater input frequency whether the repeater
]is open or closed or even if there is no local repeater at all.

Yeah, this is true. I should have said "output frequency."

]>Here, repeaters can be placed on the air by any ham with a Technician or
]>higher class license. Sometimes, for various reasons, the person
]WA2ISE> or club who
]>sunk thousands of dollars into the machine wants people who use it to
]>help him with the expense of maintenance and operation, as well as the
]>up-front cost of the machine.

Gee... we have never had trouble getting funding for our OPEN repeaters.
I would suspect that repeaters that are USEFUL are easy to get funding
for. A few years ago, six of us in AZ put up a wide area 440 link system
(with 8 repeaters on 7 sites) called NORTHLINK. We funded it initially
by using our own money, and doing tower/site work for commercial
folks to get money and site agreements. We then allowed users to
contribute $15.00 per year IF THEY WANTED TO. We get plenty of
money, and are using it to expand the system. I should point out
that this is the ONLY OPEN 440 link system in the area. All others
are closed.
]>
]I have gotten the impression (from somewheres) that if you join one repeater
]group that runs an open machine, that you don't need to join (ie, fund) other
]machines that you might occasionally use. And that your group lets other
]people from other repeater clubs use yours.

I think that, in general, if you use an open repeater a lot, you
should contribute to the costs. If you use it occasionally, you

don't need to, although it might be a good idea.

>How 'Bout getting a Tech license? :-)

That is my tech license. I hadn't had my novice license for a week when I
went to take the tech test. Because of such a short time, I decided to keep
ooit. :^)

BTW, you were hitting the .310 machine real nice from Crystal Peak (why
isn't it called peak 11?).

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

But this technology is not available anyplace except the research lab at the present time. Therefore, CW still holds a strong advantage. When this technology makes it onto the market, and is published about in the amateur magazines (fat chance of that in the USA), then I will agree with you. I still don't know anything about this technology, except that people have claimed that it exists, because it's not my field. I would like to know more. Perhaps you can point me to a couple of papers?

This is a valid point. However, I think you are overlooking the fact that this type of equipment does not come FREE. I have seen quite a few people break into ham radio using tube and hybrid rigs because they could not afford the fancy new appliances with all the bells and whistles. The advantage of CW is real in weak signal work. The illusion is that technology solves all of our problems. Then again I only have 22 years of licensed operation to draw my conclusions from...

Brian Kantor mentioned that the VE's in his area required the applicant to take the CW portion before they'd give the writtens. I don't think that is the intent of VE testing. I don't see any reason why ANY applicant should be denied the opportunity to take a written and (if he/she passes) get credit for it. After all, it should be good for a year during which time the candidate can pick up the CW (speed).

Don perley writes "Liberated or not, they probably won't be interested in most of the 'ladies activities' people have been talking about here".

Why not lets us let *them* make the decision. If only a few are interested that's still no reason to deny them that activity just because there are some thin-skinned people who manufacture offense at it.

When I took my Technician exam, the VE's tried to get me to go ahead and take the Advanced and Extra written exams. They also suggested I take the code test as well even though I knew I could not pass it. I turned them down. But now that I think about it, if I had taken those tests and carried exam credit, I might have be just a bit more encouraged to relearn code. Maybe someday.

Besides, having taken and passed the code test will mean more PERSONALLY for me AFTER it is no longer REQUIRED because I will know that it was done NOT under duress. I wil have achieved it TOTALLY on my own.

I assume from this you will be taking the Novice where you have a chance to also take a Technician.

The answer is that it really does not matter. Go ahead and take it, and if you pass, great, BUT you still have to wait for a call sign. At least then you won't have to go through the phase of UNLEARNING to say "Interim

KT".

This is one reason the FCC won't (and WISELY) touch the issue of making
coordinators official. There could be some awesome legal problems in
doing so.

It's groups that behave that way that are effectively inviting coordinator
wars.

Think about where the AUTHORITY of a coordinator to deny a coordination
SHOULD come from?

> CW IS RELEVANT to all weak signal operation at VHF/UHF/EHF/SHF
> frequencies, because when signals are weak (as they often are), then
> there is only one way to get through, and that is CW. In the contests,

Why is it necessary for someone who is only interested in working SSB DX
to "get through" when SSB can't do it?

> As I said before, you can work weak FM signals, but you aren't working a
> "weak signal" mode. "Weak signal" modes implies narrow bandwidth. FM,
> even NBFM, is far too wide. FM also has the problem that you must
> almost saturate the limiter before you get a usable signal. You loose
> about 10 - 15 dB right off the bat, even if you don't consider the

> losses from the wider signal.

Wrong. You can get a readable signal on FM before the limiter is even near saturation. It isn't full quieting, but that's part of the game. FM isn't the best mode for it, but it sure works a lot better than you make it out to, which makes me suspect your abilities to work voice.

But I'd rather use SSB and NOT CW.

> If you do show up in the weak signal portion of the band, using SSB, and
> the time comes to use CW, and you refuse, then you are a lid. Using SSB
> is just fine for chatting with your buddies in the next state only 250
> miles away, but you will find that you will often _NEED_ CW when working
> weak signal modes. When you refuse, because of incompetance or any
> other reason, then you are a lid. I hope that when the time comes to
> use CW, that you will either use CW or get off the air.

You STILL misunderstand what motivates me to operate weak signal DX. The motivation does not include CW because I am interested in SPECIFICALLY getting a particular KIND of information through: VOICE. CW does NOT get VOICE through, and the VOICE is what I am interested in.

We have DIFFERENT interests in weak signal work, but you are calling me a LID and trying to keep me out just because I won't conform to your methods of operating. How would YOU feel if *I* was calling you a LID for demanding I change my goals on voice, and tried to get you off the air for not operating the way I would?

If the signal level is such that SSB cannot get through, the only thing I will be interested in at that time is to find another station that I can work with SSB. I'm not interested in working the station CW. Don't try to dictate to me what I should be interested in.

If I happen to be operating ATV at the time, I'm NOT going to be in the mood for someone complaining about a P0 picture and trying to get me to switch to SSB or something JUST TO WORK ME. When I am on ATV then I am on for working ATV and that's it. When I am on SSB I'll be there to work SSB and that's it.

Ken...

Your life would be a LOT nicer if everyone knew CW at 13 WPM or more. So petition the FCC to add:

97.1 Basis and Purpose.

The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:

(a) ...
(b) ...
(c) ...
(d) ...

(e) ...
(f) Contribute to the well being, convenience, and happiness of operators who prefer, at times, to operate using manually keyed Morse Code Telegraphy.

I have an airplane band HT which is proving to be quite useless. It seems that the battery will not stay charged long enough to use it. The radio is an STS 600 (I think???) walky. I do not have the owner's manual and there never was a schematic included there anyway. I also know that STS has long since gone out of business.

If I put the HT on the wall charger (the battery is a SEALED 7.2volt case), then I can turn on the radio and use it normally. After charging it for 18 hours or so, if I use it immediately, I can listen to it for an hour or so before it goes dead. If I try storing it FOR ANY LENGTH OF TIME (like from my room at UWisconsin down to the Oshkosh airshow), the radio is already dead by the time I try turning it on.

ShellEy had suggested that that the internal clock was draining the battery, so simply remove the battery until use. That did NOT work. It was still dead when I reattached the battery.

As I said, the battery is SEALED, so I can't get at each cell individually and check them. Note that this is the second battery. The first one was doing the same thing, so I bought a new one (at $60) and still get the same results. This radio COULD be useful to me as a DFer (for 121.5....I'm in CAP)....I have used it as such a couple of times in past....but it's been quite frustrating to use, since it's almost always dead when I need to use it.

Any suggestions would be in order.

Thanks much.

WHAT??!? I know that no one individual OWNS a frequency, just like
a broadcaster doesn't OWN the frequency that they are licensed to transmit
on. But I think this tactic of moving an "open" repeater onto an
existing repeater's frequency has been tried in L.A., and was always
resolved in favor of the repeater that was coordinated there first!

Was the above REALLY written by the normally sober and level-headed
Mr. Karn?

Did I miss something? I originally heard that the problem was a patent dispute involving some kind of scan mode or something really stupid like that. Later I read (in 73 or QST or something) that it wasn't that at all but rather just production delays and marketing decisions. They can't keep up with the S series transcievers yet so they decided not to gear up on the R-1 yet. Nothing at all having to do with cellular.

> My IC-24AT allows me to enter frequencies in the cellular band when I enable extended receive, but claims that the synthesizer won't lock up in that range. Since it locks up solidly just above this, in the 902MHz band, I wonder if it's just lying to me and was programmed not to allow reception at these frequencies by faking an unlocked synthesizer.

I think that your 24 may be slightly frobbed. Mine is stable up to about 940. Even there is recieves, just the `U' blinks on and off.

On a similar note: has anyone got the out of band TX mods to work?
We couldn't get it to go with the Icom mods.

Thanks and 73s, jv

Well, people in 4 and 6 land have had to deal with that now for a while. When the 1x2 and 2x1 calls are gone from the extra group, you will get a 2x2 call starting with AA. Here in 4, we are up to AC4xx in the extra groups, and are almost out of tech/general calls (we are in N4Zxx, and close to N4ZZZ). Heck, the novice calls have gone thru most of the KC4xxx calls!

Personally, I would hate an AC4xx call, so when I get my extra (not IF, but WHEN...), I'm keeping my call and I'm gonna look for a job where there are 1x2/2x1 calls left!

Not to bring up a old topic, but it is getting almost necessary for the FCC to recover old calls and reissue. I'm not saying that I like the idea, but there may not be very many other choices left.

BJ

Sure Was, I work for Cellular One in Florida. We are owned by McCaw communications in Seattle (IF you noticed my id). Under a hurricane for Florida or an earthquake for Calif, you know people want to know whats going on. AT&T was busy to the point they didn't try to charge for some of the long distance as everyone was calling in and out to see if Aunt June has crushed by a brick wall or the 880 interstate.

>   pair the whole way.

Guess again, What do you think twisted pair does??? Wake up! We send the call to the hub that is closest to the exchange. Thats why if I call a West Palm Beach number from Miami, its thru our network, not the local Bell company. SO, if Ma Bell can't get you thru, we might be able to.

> If the cell hub CO goes down (or the uwave dish is thrown out
> of aim), all the users of that whole system are out of luck.
> If a cell site fails or loses a tower, you'd have to find a
> working cell somehow and hope it wasn't swamped.

If the uwave dish is thrown out, its got to kill both dishs. If Both are out, we attempt physical dial backup. If the whole tower is shot, there is not much standing in the area to help anyhow. Think about it. You best believe California is going have laws to ensure proper installation, that includes earthquakes (Florida, its flooding / Hurricane wind forces!)

>2) There are two cellular providers in the bay area, as for other

(Cellular One and most likely Bell)

> places too. I have heard (from someone whose job is to care about

> considered seismically safe: one is on an upper floor of an old
> building in Oakland, and the other is in a liquefaction zone
> somewhere else in the east bay, from what I understand.

That may just be one switch in the network. The network is designed to allow more that one switch to fail. I will admit we take every step to keep the switches up and running. The Fort Lauderdale switch has Battery backup for over 8 hours and a generator (with fuel to run 1 week continuously) in case Florida Power and Light becomes unavailable.
I am fairly sure that the sites in Calif have similar setups as we are both owned and operated the same way.

>3) As has been pointed out before, these people are not in the game

> only if the revenue to come from it times the chance of it
> happening is greater than the cost of preparing for it. Does an
> earthquake-tolerant cell phone system qualify for this? Probably
> not for a big shaker, I would guess.

Building an Earthquake-tolerant cell site would be important. We would want to protect our equipment, don't you? ;-) Now as to the PROFIT:

<FLAME ON> Hey, Last time I checked we where all in the HUMAN race, You may not qualify! But I KNOW and HAVE SEEN this company go out of its way to help the community. If a major emergency hits, we will do everything we can to help, ITS OUR HOME! You best believe that I will be on the Ham bands relaying messages AND using the cellular phone to get supplies for the local hospital or what ever service I can be to this area. I know that others in the company who would be giving blood, driving supplies, etc... You have a LOT of nerve saying we are in it for PROFIT, especially during life threating emergencies. BTW HP is not exactly a "NON-PROFIT" group according to the news today in the stock market section. <Flame off>

I am looking for the latest shareware version of Super Morse which acording to last months QST is version 3.11. I did find version 3.09 in the simtel archives. If anyone knows were I can find a copy or has one and could send it to me via e-mail uuencoded it would be appreciated.

Tanks in advance,

I just purchased a LORAN-C for my 32' sloop. It also has a Yaesu FT107M
ham radio HF tranceiver aboard, connected to a heli vertical.

I'm a bit worried about how the LORAN equipment will handle 100W of RF being
radiated 6' from its antenna/coupler... currently I disconnect the LORAN
whenever I use the ham rig; am I being excessively paranoid?

I have a question about charging ni-cad batteries. I built an external
power-pack that holds 8 D sized nicads wired in series. To charge I
can pull them all out and drop them in my charger which happens to
hold 8 cells. I'm wondering if I could simplify things by charging
though the plug I have on the battery pack. These cells are Panasonic
bought in bulk at a local discount store. Label says charge at 80-100
mA for 16 hours. I'm using a Panasonic Model BQ-8B charger right now.
Any simple alternates to charge this -- Without resorting to computer
control as in QST? I'm happy to wait 16 hours. Can I use some
inexpensive pwr supply such as I might have sitting in junk box?

(Sorry if this was covered in the previous ni-cad discussions. I
was on vacation and had quite a few hundred articles backlogged and
some also expired from our machine.)

I'd like to find out if anybody on INFO-HAMS has done business directly with amateur radio firms in Great Britain? Back in April I joined the Radio Society of Great Britain (RSGB) while at the Dayton Hamvention, and finally started getting the monthly magazine "Radio Communication".

I'm having a good time, seeing the difference in the types of articles; the `demise-of-Ham-Radio-Magazine', and `changes-at-73-Magazine' discussions, here on INFO-HAMS, have made interesting reading, with `Radio Communication' as a comparison.

Well, like any ham, I started going through the advertisements, to see how they differed. In general, I'm seeing the same Japanese ham gear as we see in the magazines here in the states. There do seem to be a few more small/specialized operations advertising in `Radio Communication' (QRP & CW interest there seems more obvious). I was pleased to see (being a `true believer') that Tentec seems to have good visibility over in England.

Now I've got a `problem'; there are one or two British firms that I'm a bit interested in perhaps buying something from and, I'm in the situation of never having tried to buy something directly from overseas.

I've written letters (with SASE's, or SAE's as they call them, along with IRC's), and am waiting to see what kind of response I get.

I've talked with the local (Dallas area) U.S. Customs people, to see how Customs Duties might affect the final price of something. For amateur radio gear, it doesn't sound as though there's going to be very much of a problem. I'm hoping that the British firms will have had enough dealings with hams overseas, so that they'll know how to conduct business with somebody in the U.S.

I'm less sure of how to handle the money situation. When I joined the RSGB at Dayton, they just took my personal check, and did whatever had to be done to keep their accountants happy. I've talked to my bank, and it turns-out that they have a branch in England but, they want a ten-dollar charge to generate a Bank Draft or, THIRTY DOLLARS to wire money to England. Good golly ... I'm looking at buying a CW key that will cost (maybe) $40 - $50; a $10 charge on top of that would be unreasonable.

I'm curious as to how to go about buying some British stamps? Sending IRC's (to try and ensure a response about a product brochure) is rather expensive. The local (Dallas) British Consulate was kind enough to give me the postal rates, for airmailing letters from Britain to the U.S. and, it's about the same as going from the U.S. to Britain. Most of the British firms ask for 3 IRC's from overseas hams, for return postage; at 95 cents for each one, that adds-up really fast. I figure it'd be cheaper just to send some British stamps along with my requests, as

long as I can buy them for not too much of a mark-up over their face
value.

So, if anyone `out-there' has experience in doing business
with Britain, I'd like to hear about how it's done.

Thanks,

Paul Nix (WB5AGF)   InterNet: nix%muppet.decnet@consrt.rok.com

Many British firms take credit cards (including the RSGB!). Access =
Mastercard, Visa is the same. The credit card companies do the
conversion at a "wholesale" rate, which is better than you can get at the bank.

For transactions where credit cards don't work, I have used Pound
Sterling traveler's checks. You can get American Express versions of
these at many banks. I haven't seen denominations less than 10 pounds,
but I use these for such purposes as paying my G-QRP club dues (which
are 5 pounds; I send in dues for a friend as well.) You could ask for a
credit voucher or extra goodies instead of change, or just write off any
overage.

]In article <1990Aug1.213344.1217@bellcore-2.bellcore.com> karn@thumper.bellcore.com writes:
]>Yes and no. Yes, a closed repeater is the property of its owner and he
]>doesn't have to let anyone use it. On the other hand, the channel on
]>which it operates is NOT his property, and he has no right to deny
]>it to others who would operate an open repeater on it.
]
]OK, fine.
]
]Let's take the repeater I operate on - private, in the sense that you
]are asked not to use it unless you've been approved by the trustee.
]Since it's not open, the coordinator decides to tell him to either open
]it up or get off the air. I can tell you what Jim's reaction would be:
]he'd tell the coordination body to go to hell, and leave it on anyway.
]The coordinator could not force him to shut it down. If they tried to
]coordinate another repeater on the same channel, Jim would sue so fast
]your head would swim - because the rules were changed in midstream. Why
]should a coordinator invite a lawsuit in today's litigation-happy
]society?
FLAME ON
Sounds like Jim is hardly a credit to amateur radio, if he is willing
to sue a volunteer over a hobby related manner! Who is this guy, anyway?
What's his frequency, so I can use it for simplex operation next time
I'm in the area?

What makes him think he has exclusive claim to a frequency? What gives
him that right? And, don't tell me that stuff about his expensive
equipment, etc. The frequency, a limited natural resource,
is the issue!
FLAME OFF

He may tell the coordinator to go to hell, and leave it on. That's
his priviledge. However, once he is de-coordinated he no longer
can claim interference if someone "unauthorized" is using his
input frequency.

]
]I'll take your complaints a lot more seriously when you sit in the hot
]seat for a while. You won't get your teeth kicked in if your ideas are
]implemented; I will.

Having been involved in coordination for ten years, including a very nasty repeater war, I think I qualify for "hot seat." I still think that coordinators are doing a disservice when they coordinate closed repeaters in a crowded band. By the way, I proposed at the repeater owners meeting here in AZ (which is also the coordination council) that they no longer coordinate closed repeaters. My motion failed about 60/40, due to the large number of closed repeater owners voting.

I've bought things other than radio equipment from Great Britain. I've always just used my Visa card and let Visa fight with the exchange rate question. From what I've seen on my bills, the exchange rate is quite good considering the small size of the transaction. (There doesn't appear to be a flat conversion fee in it either.)

I heard a guy on 10 meters the other night with N6ZZS. They're gone for
sure. I asked a similar question back in March. I called the FCC and
was told that when the N6xxx calls were gone that Novice, Tech and
General callsigns would *ALL* be KC6xxx. I studied hard and passed my
tests at the end of March. I was KC6KFX and now N6ZEK. (as an aside,
I almost got N6ZED - This is "N" "6" "ZED" - a 1x1?)

The FCC did say that if you wanted they would issue another KC6xxx call
or you could keep KC6LZF.

Good luck on Saturday!

| > (say, 30 days).
|
| It probably won't simplify things since recording CSCE data like this is
| a new and different procedure they've never done before. It would probably

| be best to just have a distince class.
+---------------

Phil, what is the practical difference between the suggestion above and the
current situation when a person upgrades but keeps his old call sign? Whether
it's called a "class" or an "accreditation" or etc. doesn't much matter.

>than picking a long enough shift register).

This is quite true. We used a simple 15 tap shift register to generate a 2^15-1 sequence of data bits that were XOR'ed with the digital data in a TDMA transmitter. It spread the data out quite excellently, except when we accidentally fed it a correlated input (correlation meaning we fed it the same 2^15-1 sequence as data that it was using to scramble. The data was just shifted in time due to delays incurred in the signal path). The receive side used the same PN sequence generator and both were started at a known point in the data stream. It turns out that if you are transmitting continuously with 'random' data (like voice), the scramblers can be set up to lock together quite easily within a short period of time. Assuming the data rate is high enough, it takes just a couple of seconds to do this. Then again, we were using 8 mbit/sec data streams, so things just work faster...

A simple tapped shift register works quite well for evenly spreading the frequency spectrum of just about any signal you want to send. Synchronizing the receiving PN scrambler to the incoming data can be tricky, but is doable.

The BBC and Deutsche Welle have a shared relay base in Antigua, which is all of about 30 minutes from St. Maarten by air. You should have absolutely no trouble hearing them whenever they are on the air. The BBC World Service is relayed from Antigua on 5975 kHz in the (local) late afternoons and evenings; the Deutsche Welle German service is on 6100 in the (local) evenings - sorry that I don't recall the frequency used by the relay station for the Engish programs, but it shouldn't be hard to find.

As a die-hard Caribbean-o-phile (to be accurate, a die-hard Windward-Islands-o-phile), permit me to make one suggestion: if you are at *all* into SWBC DXing, do plan on spending some time DXing South and Central America from the eastern Caribbean. Even in the summer, despite the static, the props are at least halfway decent, and you'll have no trouble hearing at least 10 stations on 90 meters at any time between dusk and dawn.

When DXing from the Windwards I tend to use Radio Nacional de Paraguay on 9735 kHz as my propagation beacon for 31 meters. If its coming in *really * well (it comes in at least O.K. even during most of the daylight hours), I start hunting for exotic stuff from the "southern cone" of South America. Admittedly the Windwards are 300+ miles south of St. Maarten, but on the whole my suggestion applies equally as well to the Leewards such as St. Maarten -- I know, its worked for me pretty well from St. Kitts & Nevis.

You will have little trouble logging a decent number of Peruvians and Bolivians on 90 and 60. For me, bagging these stations gave me the most pleasure. They are REAL DX targets, and that Andean music is unbelievably haunting and beautiful.

My beacon for Central America on 90 is TGNA, "Radio Cultural" on 3300 kHz, from Guatemala City; for 60 I tend to use HRVC, "La Voz Evangelica de Honduras" on 4820 kHz from Tegucigalpa.

Lastly, the number of Venezuelans and Columbians - particularly on 60 are astounding. I'm not much of a Brazilian DXer, so I can't say much about how the DX is from that country -- on the other hand, I can't imagine that its much "worse" than from the rest of South America; the only drawback is that you'll have to get youself up and out of bed a litte earlier. :-)

Have fun and 73.

Close but no cigar Pete.

You want to leave the stub OPEN at the end so the other end looks like a short at the required frequency. Also you want to DIVIDE by the velocity factor the free space quarter wavelength to get cable length.

Wait! Of that +50dbm of ERP, how much is out-of-band? My impression
of SS is that we are required to keep intentional radiation inside
the band. Therefore the only power that can pass into the out-of-band narrow receiver is that small percentage of the total transmit
power contained in spurious responses that happen to be within the
passband of the narrow (20khz) receiver. Therefore simply subtracting
and getting -50dbm doesn't seem to be valid.

Also SS on 2m? I guess I need to reread the rules, I thought SS
had to be 420Mhz and above.

Reread what I said. We added a cavity later because the narrowband

equipment was bothering us; not the other way round. I agree that
real wide spread spectrum should have even better characteristics.

>that hard to control.

A savvy operator can usually control a pileup. What we're talking about is the guy who's just getting on HF after getting his HF license in one of the "rare" countries. He can be literally driven from the band by DXers. And being in a "rare" country, almost by definition there is nobody he can turn to for advice on how to handle the situation. So he leaves ham radio with a bad taste in his mouth and a distorted picture of hordes of wealthy people from industrialized countries screaming at him from powerful stations for the sole purpose of exchanging a meaningless number and a callsign. Then months, even years later, he receives tons of mail demanding that he send expensive replies. There is little wonder then that, at the next WARC when he is representing his country as one of the few electronic experts they have, he will turn a jaundiced eye toward the amateur spectrum.

>Another point that needs to be made is that the US isn't even close

>end of more than a few big pileups in the last 10 years I've heard
>rotten operating from stations all around the world. I'm not going
>to bother and single any particular country out but we(US hams) have
>loads of competition for the title of "lids of the year."

Just because we aren't alone in being obnoxious boors doesn't mean we are right. Look, I'm not saying DX contesting is wrong. I'm just saying that a 24hr a day, 7 day a week, 52 week a year, all band contest is harmful to amateur radio. I think it's way past time that the contest sponsors rethink the whole deal.

John, surely you don't mean to claim a right to maliciously interfere
with other amateurs...but that's exactly what that claim amounts to.

[question about various types of ham software for Apple II computers]

Since two people have brought up this subject recently, there may be
others who are wondering the same thing. So I'm reposting the following
information.

****
Apple II Amateur Radio Software
List compiled by N6BIS, 2/25/90

The information in this list was obtained mostly from flyers supplied by the software vendors, or in some cases from reviews in QST. Please check with the vendors for the latest product details, pricing, etc.

The products in this list are not endorsed by Apple Computer, Inc.

PACKET RADIO

PACHAM
Uses a two-microchip interface instead of a TNC.
DaJu Development Company, 39 Long Ridge Road, Carlisle, MA
01741. $49.95

MORSE CODE PRACTICE

Morse+Plus Morse Code Tutor
EPO Software, 7805 NE 147th Avenue, Vancouver, WA 98682.
$15.95

MORSE CODE & RTTY OPERATION

HAM
Sends and receives both Morse code and RTTY.
DaJu Development Company, 39 Long Ridge Road, Carlisle, MA
01741. $49.95

Code Machine
COTEC, 13462 Hammons Ave., Saratoga, CA 95070. $29.95 (discount
if bought in conjunction with another COTEC program)

RTTY Machine
COTEC, 13462 Hammons Ave., Saratoga, CA 95070. $29.95 (discount
if bought in conjunction with another COTEC program)

SATELLITE TRACKING

Apple QuikTrak
AMSAT, PO Box 27, Washington, DC 20044. $25 for AMSAT
members; $35 for non-members

ANTENNA DESIGN

Antenna Design & Dimensions
EPO Software, 7805 NE 147th Avenue, Vancouver, WA 98682.
$9.95

Antenna Trap Designing
Larry East W1HUE, 119-7 Buckland St., Plantsville, CT 06479.

Send formatted disk with stamped, self-addressed return disk
mailer.

LOGGING

Electrolog II
EPO Software, 7805 NE 147th Avenue, Vancouver, WA 98682.
$18.95

Contest Log & Dupe Sheet
EPO Software, 7805 NE 147th Avenue, Vancouver, WA 98682.
$13.95

Could it? Doesn't the cellular system still depend on Ma Bell's phone lines
for any calls outside a cell? The phone system nearly always overloads
in any widespread emergency, and adding the capacity to handle this would
be EXTREMELY expensive.

I have never heard of channel capacity being a problem on repeaters during emergencies. We have over 100 repeater/simplex channels on 2 meters alone, and most repeater groups are more than willing to vacate a repeater for use in a true emergency.

Of course, 20 meters is another story -- one or two anonymous jammers can wreak havoc. But even here, the problem is not channel capacity.

>as such? I see absolutely nothing chauvinistic in providing activities for
>ladies who choose not to be Hams! No one is trying to keep lady Hams out
>of the Ham activities, either, either as far as I can tell. Lighten up!

I interpreted the flyer the same way Derek did: that the organizers expected all the women attending the show to be more interested in fingernail polish than ham radio. That's not just "providing activities for ladies who choose not to be hams"; it's providing only certain *kinds* of activities. And it makes me gag, too.

I should state up front that in many cases, the organizers are probably correct in assuming that this is the kind of activity non-ham wives want to attend. It pains me to admit that, but having inadvertantly wandered into a jewelry demonstration at a ham convention once, it appears to be true.

However, I believe that any convention group that offers only such activities is selling everyone short. How about a forum for non-ham spouses of hams introducing them to the hobby? I think I saw such a meeting advertised at one convention. Some conventions even offer one-weekend ham classes, with Novice testing at the end.

Okay, so not every non-ham spouse will want to attend a radio forum. There must be unique cultural or historical features of any city that an out-of-town visitor would like to see; why not arrange tours to these? Heck, I'd gladly skip an antenna forum to attend a taping of "Austin City Limits." :-)

>No one is trying to keep lady Hams out
>of the Ham activities, either, as far as I can tell. Lighten up!

From what Jon Covington said, some convention organizers *do* seem to feel that "ALL ladies" would rather play bingo than attend radio forums. Derek isn't imagining that this attitude exists.

>We are in the 20th century, Derek, so let's not forge into the 21st making
>believe there is only one sex.

That's not what Derek said at all. He was simply requesting acknowledgment from ham convention organizers that not all women these days want to attend makeup and jewelry demonstrations.

A related incident: a female ham friend of mine who's very active in emergency communications was asked to speak at the YLRL (Young Ladies' Radio League) forum at a convention a couple of years ago. She reported to me later that the members' favorite activity was making little gifts for each other--potholders, jewelry, stuff like that.

I am *not* criticizing the women who enjoy this; it's thoughtful and undoubtedly gives them a feeling of satisfaction and friendship. **But it isn't the sort of activity that grabs the souls of businesswomen like Susan and me.** I think that's the point Derek was trying to make: yes, there are women (especially non-hams) who enjoy the kinds of activities the Austin convention was offering them. But there are lots (perhaps the 30s-40s crowd who have their own careers) who would prefer a broader and more intellectual choice of alternative activities.

I think Fred is on the right track, trying to do something about the incentive licensing scheme, but I think there are a few adjustments to be made.

Trading frequency for power, well, I don't thing very many people will buy this. Also, allowing 5wpm people in the current general and advanced space will not be accepted by the world community unless we can get all of them to change.

No, I think something like what is used in Europe would be better:
With a few ammendments.

There should be 3 classes(for now)
1) A little HF bandspace, a little VFH bandspace, and not a very hard test.
  like the current novice, but without the code.

2) VFH - all VFH privelages
3)) HF - all HF privelages -(must know 13wpm code)

2 and 3 could be merged in a few years.
Yeah, I know this will get rid of some of the Extra Bandspace, but this will push organizations to do proper band planning. Frankly, there is no reason why there has to be a law that only extra's can be in the extra space. It should be that that space should be allocated for high speed CW traffic, whoever wan'ts to use it.

Just some food for thought

I have gotten the impression (from somewheres) that if you join one repeater
group that runs an open machine, that you don't need to join (ie, fund) other
machines that you might occasionally use. And that your group lets other
people from other repeater clubs use yours.

I suppose after a beginner finds out about the above (if true), he'll settle
onto a favorite repeater, and eventually join its club. Guess the same thing
holds for packet; I joined (or sent money to) the group that runs my home BBS
(KD6TH, RATS). I do more packet than talking, anyway.

dube@cpdvax.csc.ti.com responds to my posting as follows:

>>What's with Derek Wills? Can't ladies be ladies? Can't they be recognized
>>as such? I see absolutely nothing chauvinistic in providing activities for
>>ladies who choose not to be Hams! No one is trying to keep lady Hams out
>>of the Ham activities, either, either as far as I can tell. Lighten up!
>>There ought to be room for everyone at the Austin Hamfest.

>>73,   Dube   N5PDK

Perhaps I didn't make myself clear. What I was objecting to was the clear inference that if you are at a hamfest you are either (a) a ham, or (b) a woman. I further objected to the fact that the only activities for the women involved personal adornment and 'crafts', and that these were alternatives to 'staying at home"..

Am I so unusual in knowing women who are hams and whose husbands are not? Were I a non-ham husband of a ham, I don't think I'd want to attend sessions on face-painting and fingernail preservation. I've never organized a hamfest (and have never attended one), but aren't there ever sessions on "how to become a ham" or "what hamming is about", which ham spouses could go to in order to find out what all the spousal excitement is about? Why not tours of the city (there are plenty of places in and around Austin)? My wife has an astronomy Ph.D., and if I suggested that she accompany me to the hamfest and attend the beauty sessions I'd be in REAL trouble :-)   OK, so you don't schedule sessions on the latest in astrophysics, but you don't go to the other extreme and assume that women spend all their time at home or in the beauty parlor.

I do, however, agree with Dube's last line (above) - "There ought to be room for everyone...." That's what I was trying to say.

]>input or output frequency! If I want to carry on a simplex conversation
]>on the input frequency, using the repeater's PL, that is my right!
]
]John, surely you don't mean to claim a right to maliciously interfere
]with other amateurs...but that's exactly what that claim amounts to.

You're right, Jay, I don't mean to claim that right. Look up the definition of malicious interference sometime. In general (ignoring the FCC's toothless statements about repeater coordination), the

rule on a frequency is first-come, first-serve on a per-QSO basis.
So, if a private repeater is not in use, and I strike up a conversation
on its input with someone else, I am not in violation of ANY FCC rules.
Now, let's say someone comes along and wants to use the repeater, so
they get on and start talking. THEY are guilty of interference.

NO ONE is guilty of malicious interference unless they intend to interfere
with a conversation. Malicous interference requires INTENT. Believe me,
having been involved in the successful prosecution of 2 cases of
malicious interference, I know that you need to show intent in order
make the charges stick.

So... having demolished malicious interference... lets consider other
FCC rules. The FCC has said that interference to a coordinated repeater
has primacy over other users of its frequency pair. That means that
if a repeater is coordinated, and you do what I described, AND it
causes interference, the FCC might go after you for "good amateur
practice" violations. If the repeater is un-coordinated, they would
go after the repeater USER, rather than those who were already engaged
in conversation on its input.

Now... I'm not going to go around talking on closed repeater inputs in AZ -
there are plenty of other frequencies to use. If their weren't, however,
I suspect that the closed repeaters would lose their coordination. In that
case, I would use their inputs for simplex.

Commission's Rules Concerning)
the Establishment of a Codeless)
Class of Amateur Operator License)

To: The Commission

COMMENTS OF BRIAN KANTOR

August 1, 1990

Summary

The author believes that the Commission's proposal for a codeless Communicator class of Amateur Radio license is an excellent idea and will be instrumental in generating new interest in Amateur Radio. It has long been apparent that the Morse code requirement for any class of Amateur license has been a barrier to the entry of many otherwise qualified people into the Amateur radio service. Since Morse code is rarely used in VHF and UHF communications, there does not need to be an examination requirement for a license that would permit operation only above 30 MHz.

However, the author strongly disagrees with the proposal to exile these new codeless-class licensees solely to frequencies above 220 MHz, and instead believes that it would be to the greater benefit of the people of the United States and the Amateur service to allow these licensees all amateur privileges above 30 MHz.

Further, the author feels that the Commission's desire to simplify the Amateur licensing structure is a good idea, but believes that the Commission's proposal to eliminate the ``lower'' grades of license is the wrong approach as it will discourage the entry of new hams into the Amateur radio service.

Discussion

Advancing the USA's technological leadership

In today's technologically competitive environment, anything we can do to encourage interest in scientific and technical fields can only be to the benefit of all the citizens of the United States. I feel that the proposed no-code license will further this goal, since it will encourage many young people to enter a technologically-demanding hobby, and may well influence their choice of career in favor of engineering and scientific work. At a time when surveys show a greater-than-ever decline in scientific knowledge and interest among high school and college students as well as the public at large, it makes good political and business sense to encourage our citizens to pursue those interests that placed America in the position of world leadership that it now enjoys.

Many of the other nations of the world have codeless amateur radio licenses. In fact, few countries which permit amateur radio do not have some class of codeless ham license. In effect, the US requirement that all ham radio licensees learn and demonstrate Morse code proficiency is losing our country the competitive advantage of encouraging the technological progress of many qualified citizens through their participation in the amateur radio service.

Morse Code is a barrier

The requirement of learning to send and receive Morse code is often mentioned as the one entry barrier by many technically-inclined individuals who would otherwise have become ham radio operators. These people do not believe that their time would be well-spent in learning a largely useless ``skill'' that is of no practical application in modern communications. They (perhaps rightly) view learning the Morse code as a kind of ``hazing'' they would have to pass in order to join the fraternity of Amateur radio operators.

Therefore, the elimination of what many consider an obsolete and superfluous requirement for entry into the ranks of Amateur radio would clearly be to the benefit to the Amateur service as a whole, since interested people will now be able to join in. Some of these will already be technically advanced in the electronics and radio arts. Others will be beginners who will learn from their ham radio experiences. Many of both groups will contribute to the advancement of the radio and electronics arts.

The Need for Morse Code Proficiency

It is clear that in today's advanced radio environment, digital and voice modes have supplanted all but a tiny amount of Morse code communications.

It is no longer necessary for a competent radio operator to know Morse code; Morse is rarely used outside of the amateur radio service. Much of the non-ham Morse is mechanically sent and received using automatic equipment, so that the operator really does not need to have a knowledge of Morse. Indeed, many ham radio operators use such mechanical devices instead of manual methods to send and receive Morse.

Thus a ham license which has no Morse code requirement will still promote a reserve of trained radio operators.

Morse code is rarely used in VHF and UHF communications, and while it is often heard on the HF Amateur bands, it is only one of many modes in use there. Although Morse is popular among a subset of hams proud of their skill, a great majority of amateur communications are by voice, with the use of digital communications methods (such as packet radio) increasing by leaps and bounds. Even the traditional advantage of Morse for weak-signal communications no longer holds true: digital signal processing techniques have yielded communications systems which can be built by the ham experimenter that will provide reliable communications at received signal strengths far below those at which the human ear can even discern that there is a Morse signal present.

The argument has been advanced by some that the Morse requirement serves as a useful ``filter'' to keep out the less-disciplined or ``rabble'' elements. That is clearly not true. In countries around the world, there are many codeless amateur radio licensees, and yet no higher percentage of rules violations seem attributable to these operators. Additionally, one need only look at the few ``bad apples'' currently to be found among the amateur ranks; it is notable that these seem to be roughly evenly spread among those of all license classes, even those with the higher grades of amateur license which have more difficult Morse code requirements. Clearly the existing Morse requirement has not filtered out the few undesireables.

I do not believe we will see an influx of hooligans as a result of establishing a non-code class of ham license, since there will still be an examination that a prospective licensee must pass to demonstrate his knowledge of regulations, operating procedure, and technical knowledge.

But Morse code does have a place in the tradition of amateur radio. I do not propose at all that the Commission ban Morse code. Undoubtedly those who are interested in preserving this nearly-obsolete mode of communication will acquire the skill and equipment, and keep Morse alive, much as the current fans of AM do. The ability to send and receive Morse code is, after all, a skill that one can be proud of. I merely maintain that, because of its irrelevance to much of modern Amateur practice, it is not a skill that need be required of all licensees.

Against segregation of licensees

Some have suggested that Communicator Class licensees not be given the privilege of operating the six- and two-meter amateur bands. This smacks of a segregation akin to that of the suburb dweller who allows that it is ok for a member of a minority to be given equal housing privileges as long as it isn't in his neighborhood.

Unfortunately, for as long as international treaty and regulations require, it is necessary that a codeless class of amateur license must be restricted to the amateur bands above 30 MHz. However, I can see no merit in the proposed restriction of Communicator Class licensees from using the six- and two-meter amateur bands. While it is true that these are popular bands, and although these bands are quite busy in many larger communities (with thousands of amateurs making daily usage of hundreds of repeaters and other modes), these bands can accomodate more hams.

If the Commission's vision is to introduce the Communicator class of license as a steppingstone to more advanced ham licenses, it makes very little sense to segregate the newcomers from the experienced amateurs. These new licensees could learn much of the traditions and skills of amateur radio from experienced hams; keeping them apart would prevent this valuable interaction from occurring.

The most recent advances in Amateur radio technology are in the areas of digital communications and satellites. Many of the people working in these areas do not hold the higher classes of amateur license; in fact, a very large number of them (such as myself) hold the Technician class of license - the very minimum license we could get to allow us to pursue what we were interested in doing. I believe that many who will take advantage of the proposed no-code license will participate in the same ways, and it makes little sense to keep them apart.

Simplification of the Amateur License Structure

The Commission has expressed a desire to combine existing license classes and the proposed Communicator class licenses as a means to avoid further complexity in the multiple tiers of amateur licensing. I believe that this goal is a good one, but that this is not the best way to achieve it. Rather, I feel that eliminating the ``entry level'' licenses would work against the best interests of the amateur radio service. Although not perhaps the subject of this rulemaking, such a simplification has been brought up by the Commission as part of the Communicator class proposal, and I would like to submit to the Commission the following thoughts on a simplified license structure.

I suggest that Amateur radio licensing should be simplified to just three classes of license: Novice, Technician, and General.

The Novice license would be retained in its present form as an entry point to the Amateur service. The 5 wpm telegraphy, rules, and basic theory and practice examination would remain essentially the same. The license would grant the same privileges as the existing Novice class license.

The Technician license would have a more extensive theory and practice examination, equivalent to the existing Technician/General class license, but would have no Morse code telegraphy requirement. It would grant all amateur privileges above 30 MHz, and to encourage Technician class licensees to advance the next grade of license, all Novice class telegraphy privileges. Essentially, this is the existing Technician class license with no telegraphy examination.

The General license would include the Novice telegraphy test and the Technician rules, procedure, and technical examination requirements, and would grant all amateur privileges in all bands.

Incentive Licensing has been counterproductive

The ``Incentive Licensing'' scheme inspired by the ARRL and established by the Commission many years ago was in many ways an experiment to improve the quality of Amateur licensees by rewarding them with additional privileges. In a large part this experiment has not proved successful, primarily because the path of advancement of amateur radio has primarily been the VHF bands (and above) where the additional privileges to be gained by earning a higher class of license were minimal at best. (The argument has been put forth that the reason that this advancement of the state of the art took place at VHF and above was because of the restrictions cause by incentive licensing, but that is unprovable, however likely.)

Thus incentive licensing has not succeeded in its stated goal of advancing the state of the art of amateur radio. During its tenure, we have seen an ever-aging ham population shrink as fewer young people were inducted into the Amateur service. Much of this may be due to the fact that a major portion of the advancement to a higher grade of license was tied to a increasingly less-relevant Morse code requirement.

Many amateurs have expressed the thought that incentive licensing was a mistake and that it is time to abolish it. Although the ARRL, which represents a large portion of the US amateur community, has yet to take an official position on the matter, many ARRL members and directors have personally expressed the opinion that pushing for incentive licensing was one of the biggest mistakes the ARRL ever made.

Certificates of Proficiency

It is clear that many people have obtained higher grades of Amateur license because of the satisfaction that earning certifications of advanced knowledge and skills can bring. Currently the ARRL issues certificates of Morse code proficiency at levels beyond those of Commission regulated licenses, and many amateurs have taken and been awarded these honors.

I believe that voluntary organizations like the ARRL could offer examinations covering advanced technical topics and other skills, and issue certificates of achievement to those demonstrating their abilities. Far more than a few grades of license, these could examine and certify people in a variety of topics and levels of skill, and would further Amateur Radio as a self-regulating service, as well as greatly reducing the amount of administrative work the Commission would have to perform. These non-regulatory certificates of achievement would reward those hams who have demonstrated above-average skills far better than a few kilohertz of ``restricted neighborhoods'' can.

Conclusion

Thus I believe that the Commission should establish a class of Amateur license with no Morse code examination, a technical, procedural, and regulations examination equivalent to that of existing Technician or General class of licenses, and that such a license should grant all Amateur operating privileges in all Amateur bands above 30 MHz.

Further, I believe that the Commission should, perhaps in a separate action, simplify the existing license structure by combining the existing Technician, General, Advanced and Extra Class licenses into the General class of license with a minimal Morse code requirement (as required by international treaty). The Novice class of license should be retained as a beginner's entry point into Amateur Radio.

I believe that these changes will foster the growth of Amateur radio and that in turn will provide direct and indirect benefits to all the citizens of the United States.

Author's qualifications

I has been involved in radio more than twenty years, and have held a Technician class amateur license since 1971. I have been the licensee of several remote controlled, auxiliary, and repeater stations, the trustee of a ham club station. I held a First-Class Radiotelephone license, with Ship Radar Endorsement, and currently hold a General Radiotelephone License (again, with Ship Radar endorsement), as well as other Commission-issued licenses and permits.

I am interested in amateur radio digital communications and networking, have presented papers at the ARRL computer networking conference, and am the author of DARPA networking standards. I have built many amateur repeater systems, including several using microprocessor control; worked as a commercial radio service technician and systems engineer, radio station and television studio engineer; and am employed as a senior systems analyst at the University of California San Diego Network Operations group. I am currently researching basic radio networking, including the use of store-and-forward messaging systems as a means to improve the capability of amateur radio to provide communications in times of need.

I have no business or other pecuniary interest in amateur radio.

Thank you for your consideration of these comments.

Respectfully,

Brian Kantor

I recently passed my novice and Tech test (haven't recieved them yet). I purchased a Ten Tex Omni-D and have been listening to you all talk. I would like to find mods for this rig, even though I wouldn't use them for a while. I have the 10mhz transmit and WARC transmit mods from Ten Tec, (Ten Tec IS as good at customer service as you have heard). Any mods, or war stories would be appreciated. The rig seems to receive fine, and all the built in filters are terrific (especially the CW ones) but I think

it could use some help in the SSB audio department. Anyone have any nice
audio filter/speaker projects that might help me out ?

Thanks
Don Peacock

But a lot DOES exist on SSB. And a lot of the CW, ESPECIALLY THE MOONBOUNCE
is done quite SLOW. You could be looking it up on a Morse Code chart.

But the original issue with regard to the CW exam is the fact that it is just not "relevant" and should not be used, except for getting access to HF (due to international agreements) and maybe also for accessing some small high speed CW subbands with a higher speed exam.

I agree that few hams need more that 100 watts or so of power, but for those that do, the relevant exam needs to be directed at what one needs to know to deal with the high power properly, not the kind of operation most happen to choose to do with activities that usually also require high power.

If it's NOT called a class, it won't fit into the FCC computer. But the FCC will still have to keep a record of it. If it doesn't fit into their system now, they have to modify it or add a new system. That option appears to be not available. But since they have to do the work to record the data anyway it might as well just be called a class (maximum of 6 of them) and fit into

```
the present system and that be that.

I agree.

All that needs to be tested on is ENOUGH competence to properly operate
on the radio frequencies as authorized, NO MORE.  That DOES include things
like preventing RFI (because you have your choice of frequency, power, and
emission mode, which other service operators rarely have), personal safety,
and of course the rules and regulations.

For instance you do NOT need to know Morse Code to avoid being a nuisance
on the CW subbands; you only need to know that if you don't know code, you
should not be there.

FLAME WARNING

now's your chance to skip

last chance !!

> Let's take the repeater I operate on - private, in the sense that you
> are asked not to use it unless you've been approved by the trustee.
> Since it's not open, the coordinator decides to tell him to either open
> it up or get off the air. I can tell you what Jim's reaction would be:
> he'd tell the coordination body to go to hell, and leave it on anyway.

Jim who? It would be time NOW!! to petition the FCC for new rules to
allow coordinators to pull his ticket!! Actually, I'm not that serious
about the rules, but this Jim character sounds like #1 A**hole.

> The coordinator could not force him to shut it down. If they tried to
> coordinate another repeater on the same channel, Jim would sue so fast
> your head would swim - because the rules were changed in midstream. Why
> should a coordinator invite a lawsuit in today's litigation-happy
> society?

Now we *KNOW* this Jim is an A**hole (if he sued).

First of all no rules were changed in midstream because no rules exist.
Sure, the coordinators have policies, but these are NOT legally binding
and have no importance to the courts. Out goes sick Jim's one argument.

There is a definite problem in our society of people being all to happy
to sue. I would expect the coordinator to (and if it were me, definitely
would) counter-sue. While the law suit would be a major hassle for both
parties, I know which way it would ultimately go.

> I'll take your complaints a lot more seriously when you sit in the hot
> seat for a while. You won't get your teeth kicked in if your ideas are
> implemented; I will.

Perhaps we should just up and sue Jim for wasting spectrum and causing
the loss of 220-222 Mhz. At the current rate of value I'd estimate we
could ask for about 4 billion dollars. But all we'd probably get to
walk away with is his house and (now un)coordinated repeater.

It's a**holes like Jim that are CAUSING the coordination mess. These guys
need to be shutdown, and quickly, before we all get shutdown for lack of
any spectrum.

Is Jim gonna sue the FCC for loss of 220-222 Mhz?

> One reason for closing a repeater is to prevent it being taken over
> by the long winded old geezers talking about their latest operation.
> One reason for an open repeater is to welcome new people and new
> ideas. I don't have a hard and fast answer to this question. I think
> it depends on local conditions.

While I think this is a valid case for a closed repeater, as I don't particularly care to hear about what's gonna happen when I get older, I must defend the old geezer's right to use whatever frequency he wants to use as long as doing so does not interfere with other radio operations.

But the interpretation a lot of people (repeater owners) are making of a coordination is of being the "owner" of the frequency in that location, and that just is not so, even if the coordinators are saying so. The coordinators that are saying so probably deserve to be sued, as they have no authority to grant ownership of a frequency.

If coordinators, repeater owners, and others, did a BETTER job of working out the problems with coordinated repeaters, then there would be enough repeater frequency pairs to satisfy all the needs amateur radio has. As it is now, they are not doing enough. There are many reasons for this, from threatened law suits, to conflict of interest. Some coordinators try, and run into problems with others. Some coordinators just don't care to.

In the major metropolitan areas, even the UHF TV band is "full". Of course "fullness" here means just tight enough for **CHEAP** TV receivers to be barely able to slice apart the stations (30 Mhz of empty space between co-located stations). This is a HORRIBLE waste of spectrum just to save $10 per receiver.

UHF stations should be able to operate much closer and even ADJACENT.

But what is really sad is that VHF and UHF TV is a primarily FIXED point-to-multipoint service, which is more suitable to spectrum above 2 to 4 Ghz. FM radio broadcasting still tends to be mobile enough that it should not have to move up there. The appropriate usage for spectrum in the 30-3000 Mhz range is mostly mobile.

Just think of what land mobile could do with 42 Mhz of VHF high band divided into 8400 5 khz channels and 336 Mhz of UHF divided into 13440 25 khz channels (or 16800 20 khz) and trunked. I'd suggest 76-88 be used to expand FM broadcasting, and 54-72 could have many other uses.

We just need to find a place to put broadcast TV way up there.
I would certainly urge that HDTV *NOT* be allowed below 2 Ghz.

|> to sue a volunteer over a hobby related manner! Who is this guy, anyway?

John,

You have to realize that the "we can't change anything, we'd get sued" line is basically nothing more than a cop-out. Anybody can sue anyone for any reason at any time in this country. It doesn't mean a judge will agree with their grievance.

This excuse is unfortunately quite prevalent among frequency coordinators. Some time ago I got into a discussion with one of the local council members. I asked how the remaining part of the 220 band would be divvied up if/when we end up losing 220-222 MHz. I added that I thought the only fair way to do it would be to take away 40% of the repeater band, 40% of the simplex band, 40% of the packet band, etc. (This is a subject of considerable interest to me since I operate 56kb/s packet on 220.55.)

His response was "we can't tell any of the repeater owners in 222-225 to move! They'd sue us!" My response: "How do you know *I* won't sue you?" I said it with a smile, but I think he got the message. He didn't have an answer to that.

Phil

* some stuff deleted *

Cornell *does* have an ARC, but it tends to be somewhat inactive during the summer. There's also the Tompkins County ARC, of which I am also a member.

Anyway, if this mysterious person *is* at Cornell and is concerned about what to do in an emergency, have him call Ray Reynolds, AF2A, at 387-5290. Ray's the Tompkins Co. ARES EC and can probably give him the names and numbers of all the Asst. EC's as well.

In article <31.Jul.90.10:57:43.BST.#2288@UK.AC.NWL.IA> PJML@ibma.nerc-wallingford.ac.uk ("Pete Lucas, NCS-TLC, Holbrook House, Swindon") writes:
>My question is: Why does anyone want a 'private'
>repeater? IMHO a mixture of elitism and one-upmanship?
>And *such* a poor use of spectrum-space!

You'll get many inflammatory replies to this one from the anti-FM repeater crowd; here's an attempt at an informative one:

Here, repeaters can be placed on the air by any ham with a Technician or higher class license. Sometimes, for various reasons, the person who's sunk thousands of dollars into the machine wants people who use it to help him with the expense of maintenance and operation, as well as the up-front cost of the machine. Other times, as with the repeater I hang out on, the trustee simply wants to make sure that the user understands unusual features of the repeater before beginning to use it. Finally, the repeater may have been placed on the air for a specific purpose, and the trustee wants to make sure that that purpose is adhered to.

The FCC, recognizing that there is a place for private repeaters, specifically allows them in the amateur rules:

S 97.205 Repeater station.
(a) Any amateur station licensed to a holder of a Technician, General, Advanced or Amateur Extra Class operator license may be a repeater. A holder of a Technician, Genera, Advanced or Amateur Extra Class operator license may be the control operator of a repeater, subject to the privileges of the class of operator license held.
[...]
(e) Ancillary functions of a repeater that are available to users on the input channel are not considered remotely controlled

functions of the station. Limiting the use of a repeater to only
certain user stations is permissible.

Yes, I agree that some closed repeaters are that way only because the
owner doesn't want anyone but his buddies on it. Those, though, are in
the minority - and, just like a computer on the Usenet, it's HIS
repeater, and he may operate it in any manner he wishes, as long as it's
in accordance with the rules. He has just as much right to operate it as
a club that's altruistic enough to let anyone and everyone operate on
it.

If only it were so! Much of our UK VAT goes to fuel European Subsidies to
inefficient agriculture in faraway lands...
I dont know what the current import duty on radio gear is, but that there
is any import duty is all wrong. Import duty is simply a particularly
pernicious and unjust form of arbitrary protectionism.
REMEMBER: ALL TAXATION IS THEFT!
Suppose we shouldnt complain; if we do, we might just get all the Government
we pay for!

If one of the articles has a good color photo with it--or
if one can be shot--it will probably end up on the cover (see July
QST, for example).  If no good color is available, they'll run
something else.  This happens very seldom, though, except for:
1) the annual national convention cover, and 2) special-purpose
stuff like the 75th anniversary covers you mentioned.

Looking at the 8 issues of QST so far this year, only the August
issue has a cover that doesn't go with an article in that month's
issue (except for the convention cover).  (September's cover is
about the lead technical article.)

]of the pilot in command) is verboden by the FAA. Potentially
]dangerous to nav/com avionics on board.

Urban Legend Alert! The pilot of a commercial air transport plane
DOES NOT have the authority to let you use the radio on the aircraft.
It can only be used if it is tested with that aircraft for interference.
I don't know the name used for this testing, but it is similar to type
certification and not likely to actually happen. This rule is an FAA
rule related to IFR flight.

The way I listen to ATC in an aircraft is to use a passive receiver -
just a tuned crystal (well, alright, diode) detector and an
audio amp. It looks like a walkman, and cannot cause interference
because it has no RF oscillator. I don't know if it is legal or
not, but my guess is that it is.

I used to see that rule printed in airline schedules. I haven't seen it recently. Are you sure that it's still true?

Does anyone have spice models for the following NEC (california eastern labs) FETS and bipolars ?

NE 645
NE 644
NE 8001
NE 8002
NE 8004

I am using spice 3c1 (which has mesfet devices).

If anyone has any idea please let me know.

Close. Without permission from the OPERATOR OF THE AIRCRAFT, i.e., the airline. The pilot has no say in the matter under part 121 of the FAA rules, which governs air carrier flight.

And judging from what the IF stage of your typical walkperson does to the heterodyne of my aviation handheld, I can certainly understand the prohibition.

I have had people on board a small aircraft operate 2m handhelds while in flight, however. We checked to make sure nothing funny would happen to the comm radios on the ground before starting up, and the ham HT didn't seem to bother them at all. It was kind of fun talking simplex over a distance of 50 miles from a handheld.

I did, however, once get a stern warning from a flight attendant not to use my "cellular phone" on a commercial flight. Humf. At least she was closer to describing it than most other people I've encountered, who tend to call it a "pager." I mean, really. A 24AT is pretty small, but if a pager company tried to give me a pager that size, I'd complain quite loudly.

Incentive licensing was a still born idea. Where is the incentive
to upgrade when the only priviliges are a bit more bandwidth in some
bands where a good number operators have no interest. For me, HF is
nothing more than a curiosity but I have no real interest in HF
operation. I have a Technician class license which gives me all of
the privileges I need to do the things I'm interested in. There is
no bone to go for in upgrading.

We do indead have too many classes of license for which constant
upgrading is a drain on the resources of the FCC. As was pointed out
in the NTRN broadcast, the FCC can't process more that a certain number
of applications a year. Even if they could modify the program which
tracks the licenses to accomodate a new class, we still could not get
any more people per year into ham radio because of the number limit the
FCC has. Do away with the multi-level incentive licensing program and
install a simpler dual-level system where a code proficient operator
has full privileges on all bands and a no-code operator has full
operating privileges from 30Mhz up. This would relieve the load of the
FCC by DRASTICALLY reducing the amount of paperwork each year just to
handle upgrades leaving that much more time to process NEW applications.
The no-code license would then probably draw more new people to ham
radio, swelling our ranks and quiet possibly saving the spectrum we have
in the V/UHF bands. The FCC would be able to handle this rise in new
application now since they would be handling fewer upgrades.

73, Randy

I have noticed the same thing, but only over the last couple of years.
Nice covers, but frustrating once you are hooked and try to find the
material inside.
>
> I noticed this especially then they had last year's decades of ham
> radio covers with some very interesting equipment on the covers but

That is when I first noticed it too. Despite the complaints on here
(IMHO unfounded) that the ARRL is only interested in ancient technology,
I was looking forward to reading some "old-timey" material behind
the "classic covers." It was a bit disappointing.

But how are the DXer's supposed to keep track of which DX stations QSL, and
which want to ragchew? (And, for that matter, how many DXers would BOTHER to
keep track?)  There's still going to be a pileup every time the DX station
gets on the air, as long as we do nitwit things like hand out pieces of
paper if you contact enough "countries."  I agree with Wayne on this one -
can anyone really justify the existence of the DXCC as it is presently
structured?  And before you answer, have you listened in on 20 on a regular
basis, and thought what it would be like to be on the other end of some of
these pileups EACH AND EVERY TIME you got on the air?

(Some food for thought - what if DXCC-type "country chases" were restricted to
certain periods, something like an ongoing contest?  Maybe every fourth
Saturday, contact made during the 24-hour period from XXXXZ to YYYYZ would be
acceptable for DXCC.  That way, the paper-chasers could keep things going,
and the rest of us could have some enjoyable QSOs.)

I'm taking my tech test Saturday and was
wondering what the prefix of my call sign will be.
From what I can gleen off the net, they're almost
out of N6's; so what's next? NA6...? or what.
The only reason to change would be to get a shorter call.
(And I can't think of anything to do with KC6LZF)
Any ideas?

Thanx,
Jim KC6LZF

> 3)        Advanced - 13 WPM plus Advanced written test.  All privs.
```

I could be happy with this if you made 2 changes:

4) Extra - 20 WPM plus Extra written test - satellites, keep the EXTRA portions of HF bands, plus for the V.E. program.

and one other: the "full VHF privileges" concept should not include the CW-only portions of VHF bands (Yeah, yeah, 100 KHz on 144, I know, it's measly, but I think that even STRONGER steps should be taken in this direction. If the idea here is to get MORE (better?) hams, then the VHF/UHF bands will crowd up, and I think that more should be done to protect weak signal operation in these bands).

In article <LPX&-WM@splut.conmicro.com> jay@splut.conmicro.com (Jay "you ignorant splut!" Maynard) writes:
]Yes, I agree that some closed repeaters are that way only because the
]owner doesn't want anyone but his buddies on it. Those, though, are in
]the minority - and, just like a computer on the Usenet, it's HIS
]repeater, and he may operate it in any manner he wishes, as long as it's
]in accordance with the rules. He has just as much right to operate it as
]a club that's altruistic enough to let anyone and everyone operate on
]it.
There is a significant difference between the computer on Usenet and a repeater. The computer does not tie up any significant natural resource. The repeater does: its frequency pair. Here in Arizona its frequently hard to coordinate frequency for an open repeater, simply because closed systems already control the frequencies for an area. I think this is completely wrong, and an abuse of the public trust. I am opposed

to the coordination of ANY closed repeater. Sure... put up a repeater
and close it. But don't expect it to have any claim on either the
input or output frequency! If I want to carry on a simplex conversation
on the input frequency, using the repeater's PL, that is my right!

I would like the entry-level license to be "limited" as the novice license is now, only with a harder written and without the code, and with many VHF privileges. But, also, I think that it'd be worthwhile to answer your question, "Yes!" and expose new licensees to different things, including HF.

I have IC-2sat, which is supposed to not receive below 138 mhz. I performed
the multiple-button-push mod to be able to enter the 10 Mhz digit directly.
Now, when I tune to 135.65, the radio gives me a "U" in the channel display
indicating that it is not locked. However, the radio does receive just fine!
135.65 is SFO bay approach, btw. Also, farther down the aircraft band the
radio does lockup, i.e. it doesn't give me the U.

There is another mod for this radio that enables super wide range receive; like
0-900mhz. Of course, I got "U" all over the place, but maybe I could actually
receive on those freqs? I reset the radio, though, because the sensitivity
on 2 meters seemed to get worse.

>So what do I need to do to earn high power privileges? I have to learn
>to learn something totally irrelevant to those privileges: Morse Code.
>Not only that, but I have to go up to 13 WPM...

I thought about that. The idea behind the easiest (neo-Novice) license is to pick up about 90% of current VHF operation. It picks up FM chatting (repeater users, not operators -- my "owner" meant "licensee of"). It picks up packet. It picks up most SSB. It intentionally leaves out "weak signal" and especially "moonbounce". Both of those tend to use high power, and both tend to be done on CW! (Weak signal terrestrial is often SSB, but serious weak signal work often falls back to CW.)

For 5 WPM, you get a somewhat higher power limit on VHF/UHF; I didn't mean to limit Generals to Novice levels. (Except maybe on HF, where Novice power is a-plenty!) I suppose some moonbouncers may not be good at CW, but how big a problem will that really be? In the interest of simplicity, of course, I don't want to add a super-VHF license.

Very few hams need more than a hundred watts or so on VHF. BTW, I don't have a problem going to 10 or 25 watts on 1240 and up, from the current novice 5 watts, since reality says we have to match Japanese radios and not the other way around.

beam (fixed) all out of aluminum wire. I soldered it with something from the local Bradlee's store using a propane torch. I soldered paper clips to the aluminum wire at the feed point. Standing near the edge of the roof, and within the three wire grid of the driven element, I learned that the soldering and melting temperatures of aluminum are exceedingly close. As the wire melted, and let go (with tension) I still have slight marks on eyelid and forehead. But I am still glad to have frozen, rather than backing up.   (HILL ST. BLUES: 'be careful out there')

BS Gordon. At least 420-450 is completely empty out here. Listen to it
sometime. The spectrum is completely "used" by private repeaters that
are almost never transmitting! You can't get a new allocation.

I think that this "private repeater" idea has got to go if we are to
keep our spectrum. Just wait until UPS listens to 420-450 here in
Southern California and decides that they need a chuck of it. All they
have to do is go to the FCC and tell them that while we have many
repeaters in the repeater directory, none of them are ever in use!
The spectrum co-ordinators in Southern California have their collective
heads in the sand (or smog - whichever is appropriate).

But a cellphone of that size would be really great, especially with all
the receive capability of the 24AT.

     Yes, but the point that the cellular system could be made reliable
     in the face of disaster seems to be a difficult point to grasp for
     some in this forum.  Just as there are government mandated building
     codes, electrical wiring codes, etc the cellular industry could have
     a disaster emergency service role imposed on them through government
     regulation.  The simple fact of the matter is that the cellular
     industry IS a for profit enterprise and thus potentially has a lot
     more money than does ham radio to setup formal emergency service
     networks.  And the imposition need not be a hardship either, as it
     could be funded through tax incentives much as the alternate energy
     initiative was handled a few years back.

While the REPEATER may be his, the FREQUENCY (pair) is not and cannot be under our rules. Even the fact that the coordinator has coordinated the repeater does not make the FREQUENCY his.

The actual function of a coordinator, despite what coordinators, owners, and user might WANT to think, is to determine a frequency which has a reasonbly low probability of causing and receiving harmful interference.

Also, the FCC policy only deals with interference situations when it is considers to find in favor of coordinated vs uncoordinated repeaters. If interference does not actually happen, there is no problem.

Apparently most CLOSED repeaters have some mechanism to avoid being used by "non-members" such as CTCSS (PL) or DMTF codes. I'm not going into what methods are good or better, but just mentioning that they exist.

These methods would allow the lesser used and controlled access closed repeaters to SHARE the same frequency pair with nearly no interference problems.

If two repeaters are on the same frequency pair at the same location with different access means, when one is in use the other cannot be used, so no one should try. Remember that it is wrong to transmit on a used frequency, and this is probably extendable to the repeater output frequency when you know that your transmission is being repeated. Further, if these shared repeaters detected the other being busy and not key up, then there would be virtually no interference problems.

The CLOSED repeaters have virtually no usage, because most of them are that way to limit the range of people using them. The CLOSED repeaters are taking up repeater spectrum space. However in the big cities where there are no repeater pairs remaining on 2 meters, the OPEN repeaters are mostly underutilized as well, so in reality, I don't see much of a problem with CLOSED repeaters at this time. There is just not much of a need yet to get any more repeaters on.

But there is one place where the sharing of CLOSED repeaters could be tried. That is on the 222-225 Mhz band now being compressed on us by the land mobile grab. Although the portion remaining is already occupied by repeaters, the repeater subband needs to be shrunk by 40% to make the change fair to all. It is clear than many repeaters will have to change frequency, but I believe it is NOT necessary to take any off. What you do is start SHARING the spectrum. Where you have two CLOSED repeaters very close together, put them on the SAME frequency pair and require them to use some access control mechanism, and suggest they also have a means added eventually to detect the usage of the other. Alternatively, the two repeaters could be merged into one, and perhaps have 2 or more CTCSS tones to isolate the groups if they don't want to talk to each other.

Of course. But how is this worse than amateur radio when everyone picks up their microphones at the same time? Or worse, when ONE person refuses to give up a repeater to emergency use?

Yes and no. Yes, a closed repeater is the property of its owner and he doesn't have to let anyone use it. On the other hand, the channel on which it operates is NOT his property, and he has no right to deny it to others who would operate an open repeater on it.

Okay, then why is it standard practice in the telephone business to supply battery power for telephone switching machines and transmission equipment when it's needed only a tiny fraction of the time? As anybody who has priced a big UPS will know, backup power can be very expensive, and many computer sites opt to go without it. But the Bell companies not only consider standby power to be essential, but they go well beyond the usual 5-30 minute capacity of the standard computer center UPS.

A typical CO battery plant is sized for 3 to 8 hours of reserve time, and this is usually backed up with a diesel or gas turbine generator with days to weeks of fuel on hand. If the site is remote, the battery may be sized for 24 hours of operation, there may be a second generator, or solar power may be used. Smaller offices may do without a dedicated generator and rely on their 24-hour battery plants until a portable generator can be brought in when necessary. (Reference: "Engineering and Operations in the Bell System".)

The reliability and availability of the public telephone system has always been a high priority with the Bell companies. Believe me, they are VERY concerned with maintaining service during an emergency, and this commitment has continued unabated since divestiture.

I would argue that most amateur radio facilities are nowhere near as well maintained and backed up as the average telco facility.

Phil

A DX station can pretty much determine the type of action they see on the bands by how long the DX station chooses to stay in QSO with a given station. If he wants to rag chew it just isn't that hard to control.

Another point that needs to be made is that the US isn't even close to having a monopoly on bad operators. Having been on the receiving end of more than a few big pileups in the last 10 years I've heard rotten operating from stations all around the world. I'm not going to bother and single any particular country out but we(US hams) have loads of competition for the title of "lids of the year."

I've heard that R-7000's outsell most of their ham gear by a wide margin, that would imply that they either built an awful lot of them or continue to make them.   I know more people personally who own R-7000's than most other ICOM radios except maybe HT's - while they are an old design they still do things that few other scanners will...

I was half thinking of attending our local hamfest, and picked up some of the literature advertising it. On page 2, where the events are listed, there's a paragraph headed "A Word to the Ladies..." - this sounds like a bad start, and it is. "Learn new make-up tricks and how to keep your skin and nails beautiful.... no need to stay home!... "a craft for you to "make and take"".

This is downright degrading. I know that ham radio is predominantly a male hobby, but this sort of garbage just perpetuates the system. At least in my own field, astronomy, when astronomers have conferences they have the sense to realize that accompanying spouses can be of either gender, and arrange e.g. local tours, which are equally suitable for men or women.

This meeting is organized by the ARRL West Gulf Division. I've never really cared who the director is, but I do now. I'm certainly not going to their silly meeting and I'm not going to vote for a male chauvinist pig the next time around (not that I did before).

Which century are we in, anyway?

This is a widespread characteristic of hamfests. At our hamfest
this year the PA announcer (who is a woman and I think is also licensed)
made the following announcement:
  "ALL ladies...ALL ladies...there will be bingo held in forum room 2...."

She really stressed the word ALL. I couldn't believe it.
I know a fair number of women who attended the hamfests to look at
radios, not play bingo.
The Co-chair of the Hamfest Committee here is also a woman, and I am sure
she didn't arrange all of this to play bingo either.

Maybe instead of having "Ladies events" we should have "Non-Amateur"
events, or something. While we are on the subject, any suggestions for
good non-Amateur events for hamfests?? The only things I have seen
are make-up and crafts (as mentioned above), bingo, cooking demonstrations
and bus trips to a local shopping mall.

[-=-]

I will be going to St Martins (the Dutch side) in a few weeks on business and was wondering if anyone has answers to the following.

1) Is the ICOM R1 radio available here? If so, what is the price and its frequency range? (French or Dutch side of the island)

2) Is the electrical service 110 volts like here in the states? (If not ill just pack lots of batteries for the radios ;-)

3) Will I still be able to listen to my favorite north american short wave broadcasts? (Deutsche Welle, Radio Berlin Intl, BBC) Or must I switch to the central (south ?) amercian frequencies?

Any and all answers (serious ones that is) are welcomed.... E-Mail please unless all else fails.

```

There is an entirely adequate circuit in the 1989 ARRL Handbook. It describes a 3-in-1 one audio filter - 300-3000Hz, 300-2700Hz, and 650-750Hz. I built one myself, and have had good results with it. An audio filter doesn't help on front-end overload though, and I get creamed by adjacent signals that are MUCH stronger than what I am tuned into.

The circuit runs off +/- 12 volts, but it could probably be modified to run off a single supply.

The 89 and 90 handbooks also have a section on bandpass audio filters based on op-amps, so you could easily roll-your-own.

I also took the time to consult some of the Engineering books on the subject of active audio filters, and didn't find anything that was simpler or more effective than the 2-resistor 2-capacitor bandpass filters discussed in the Handbook.

With all due respect to those arguing the cellular issue, I'd like to bring up a shortcoming of cellular service. The "Carbon Canyon" fire of Southern California fame consumed some 4000 acres and 14 homes. Carbon Canyon (and other adjacent canyons) are convoluted enough to impose predictable radio problems.

In a community meeting dissecting the lack of response and organization of emergency services, one of the excuses presented was loss of radio and cellular contact by emergency vehicles. The people responsible for managing emergencies were clearly clueless with respect to the technical issues of communication. The notion of repeaters and dead spots had to be experienced (at the cost of property) instead of foreseen.

So I'm sensitized to the fact that our government emergency communications are handled by people who see cellular/radio technology to be the same as a telephone, which it's not. Were an experienced ham involved with the communication planning, I'm sure he/she would have been losing sleep over how to place repeaters for maximal coverage of our canyons and communities. I doubt that the local cellular service providers are interested in adding the two repeaters needed to meet the emergency communication services for our area.

The rule as quoted is incorrect only in that the PILOT is NOT legally allowed to permit electronic equipment to be used UNLESS the AIRLINE itself allows him/her/it to do so in ITS rules... the FAA rule give permission to allow such equipment ONLY to the "Air Carrier", not the pilot.
There is an exemption for Computers and a few other things...

We are now going to have every pilot and pilot-wannabe posting about the FARs, the FAA, and how carrying radios/computers/shavers/cattleprods onto airplanes does not/cannot/willnot/mightnot be authorized by the pilot/groundcrew/airline/stews/bagsmashers in flight/while on the ground/during a crash.

Please refrain. I'll edit them out of the digest to save the poor info-hams subscribers (if I can) but do we really need this same rec.aviation crud in the ham radio group again? It's been less than three months since the last time.

Sit on your hands. Don't post. Observe network silence. Shut up.
If you just can't control yourself, then send the guy personal mail.

Warmest personal regards,
     - Brian

Sounds like you are getting destructive interference. Is your vehicle
about 16 feet long? If so, you are exciting one end of an open 1/4
wave stub. Naturally, you are going to see a strange feedpoint
impedance. Try temporarily moving the antenna off the mirror and clamp
it somewhere back along the middle of the van, say at the open side
door. I think it will tune up well there. If it does, you'll know what
the problem is. As for the fix, I will leave that to your imagination,
but one hint is that it requires an electric drill :-).

The question boils down to: "Is an open repeater always better for ham radio
than a closed repeater?". My answer is "Yes", "No", and "It depends".

Often the most technically sophisticated, lively, and interesting
repeaters are the nominally closed ones. And the most boring, and
ineptly operated ones are nominally open. Sometimes it's the reverse.
It depends on the group sponsoring the repeater and the function it is
intended to serve. If the machine is intended to serve as a technical
intercom between experimenters, it is often interesting and serves
the best interests of amateur radio. If it is intended primarily as
an autopatch repeater for the members as a way of avoiding cell phone
charges, then it is an abomination.

One reason for closing a repeater is to prevent it being taken over
by the long winded old geezers talking about their latest operation.
One reason for an open repeater is to welcome new people and new
ideas. I don't have a hard and fast answer to this question. I think
it depends on local conditions.

OK, fine.

Let's take the repeater I operate on - private, in the sense that you are asked not to use it unless you've been approved by the trustee. Since it's not open, the coordinator decides to tell him to either open it up or get off the air. I can tell you what Jim's reaction would be: he'd tell the coordination body to go to hell, and leave it on anyway. The coordinator could not force him to shut it down. If they tried to coordinate another repeater on the same channel, Jim would sue so fast your head would swim - because the rules were changed in midstream. Why should a coordinator invite a lawsuit in today's litigation-happy society?

I'll take your complaints a lot more seriously when you sit in the hot seat for a while. You won't get your teeth kicked in if your ideas are implemented; I will.

Jordan Kossack, KOSSACKB@RICEVM1.RICE.EDU, writes;
<...After all, their income taxes are even higher than here in the States...>
Wrong. Our base rate is 25% and the top rate is 40%.

<...I never understood how the VAT (Value Added Tax) adds value to an object. Sure, it increases the retail price...>
Just like purchase taxes do.

Phil Howard, phil@ux1.cso.uiuc.edu, says;
<...Aunt Margaret wants her cut in EVERY STEP OF THE WAY...>
It's got naff all to do with "Aunt Margaret". VAT was introduced to harmonise with the rest of Europe, all of whom have VAT. We used to have "Purchase Tax", which was levied at point of sale, just like the USA. Except we didn't have the dumb system of quoting retail prices without the tax.

Anyway, the difference in prices of R1s has got nothing to do with taxation. VAT is 15%, so it can't account for a price difference of over 100%. It's got more to do with (i) greed, (ii) exchange rates, (iii) size of market & (iv) greed.

I agree. Further, I must take part of the blame; this kind of thing has bothered me before, but I haven't spoken up about it. Even more, this is one convention where I have some input, since it's also the summer meeting of the Texas VHF-FM Society, and I currently serve as its president.

I'll print a copy of your posting, and pass it along to the convention organizers.

>This meeting is organized by the ARRL West Gulf Division. I've never really

Re: Awarding DX certificates for contacts during specific time periods

Given the nature of DXing, I don't think it would work to restrict contacts to
certain dates. A better choice would be to restrict the bands that DX awards
are issued for. For example, restricting to 160, 80 and 20 would clear up the
other bands a bit for these alleged DX stations who are afraid to operate
otherwise. (No particular reason for picking those bands, other than 20 which
is pretty much wholly-owned by DXers anyway.)

It's also probably wise to consider that if the pileups are horrendous now, when
DXing is a 24-hour/365 day pursuit, the result of compressing the pileups will
be pretty ugly (especially for the "DX Derringers" who have to wait for the big
guys to get their fill at the trough before they can get a chance.)

```
                                             >>>==>PStJTT
                                     Patrick St. Joseph Teahan Taber
```

My employer doesn't care what I think. I, in turn, don't care what

you think. You probably don't care what my empolyer thinks. Thus is
life a circle.

On the same note, in 2 land the extra calls are getting
close to WZ2Z. What comes after that? I may be taking the
test next week (if I can nail down all those element numbers
and space rules :-) and want to figure out whether to go
for a new call.

Apparently they went from our own WZ2B to somewhere around "P" between
may and july 1. If I pass the test on Aug 11 I assume the issuance
date would be somewhere in mid September? If there is no "summer
surge" then it will be a close call whether I get into the Wx2x calls.

I realize that some of the newsgroups I've specified are not precisely
appropriate, however I felt they were the ones most likely to be read
by someone who could answer my question.

I would like to know of any radio frequencies used by airshow and demonstration
teams.

Of particular interest are the USAF Thunderbirds, the USN Blue Angels,
the US Army Golden Knights, the Christen Eagles, Team America, The French
Connection, The Red Baron Squadron.

Any others that you might know are also very welcome.
Tower frequencies or Airshow coordination frequencies are likewise welcome.

We are planning to video tape some airshows, and would like to patch in the
plane to plane audio and record it when we can.

THANK you all very much!!

-Ron

This brings up another point about reliability. When the cell site _does_ go down (granting that it may normally be more reliable than typical amateur installations, it still can fail) you are out of business within most of that cell. Amateurs, on the other hand, can usually find another repeater to use when the one they are using quits. (Of course, this indicates that cellular is more spectrum efficient in the normal course of events. But spectrun efficiency isn't everything.)

In the August issue of 73 magazine Wayne Green, W2NSD, writes a column "Solving the DXCC mess" about how DXCC is aversely affecting ham radio. I quote " . . . the amateurs [living in rarer countries] have been virtually forced off the air by DXers. DXers, driven by the 'need' for a QSL won't permit amateurs in rare countries to enjoy relaxed contacts." He goes on about international ill will caused by the agressive tactics of some DXers.

But surely these third world hams have the solution in their own hands, . . all they need do is to make it clear that they will QSL contacts made at the time, on the air, but will not send any cards out. The card collectors will soon lose interest in such stations and leave them free to those genuinely interested in DX (rather than awards) and/or ragchewing.

Henry Black (KK6JR, G4NOC) KK6JR @ WW6L.#NOCAL.CA henryb@hpspd.HP.COM

SB ALL @ AMSAT $ANS-209.01
DOVE WATCHDOG TIMER TIMES OUT

HR AMSAT NEWS SERVICE BULLETIN 209.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 28, 1990
TO ALL RADIO AMATEURS BT

DOVE's Watchdog Timer Turns Off Two Meter Transmitter After Three Days

Last week the AMSAT News Service (ANS) reported that DOVE had come back to life sending its familiar AFSK ASCII packet telemetry on 145.825 MHz. For 3 days DOVE was heard all over the world until it became silent again on July 25th some time around 15:30 UTC. The speculation by Jim De Arras (WA4ONG) is that a pre-programmed software watchdog timer had expired and the DOVE on-board computer (OBC) had done what it was suppose to do: shut off the two meter transmitter. WA4ONG is DOVE's caretaker while N4HY and NK6K are out of the country attending the AMSAT-UK Colloquium at the University of Surrey July 27-30. The basic function of the watchdog timer is to tell DOVE's OBC "if you don't receive a valid command from the ground each day, then reset and give a safe-mode." Since N4HY got DOVE back on-line only hours before he was to leave for the University of Surrey in England, it appears there was some confusion as to what the proper command was that WA4ONG was suppose to send to update the watchdog timer daily. The default timer expiration was three days and it appears that DOVE did exactly what it was programmed to do, turn off the two meter transmitter after three days.

Because of the problem of the two meter transmitter transmitting while the DOVE's two meter receiver was listening for a ground command had been a major headaches last time, and it was necessary to use W5UN's gigantic EME station to get a reset command into DOVE's OBC, this watchdog was added by MICROSAT software engineers to prevent the two meter transmitter being on while the two meter receiver was looking for ground commands. DOVE listeners know that DOVE transmits for 2.5 minutes and then stops while its two meter receiver listens for 30 seconds. Basically, this timer tells DOVE that if "you don't hear a valid command from a ground station each day, then something is wrong. Go to a known state and wait patiently. But before you get there, turn off your two meter transmitter and be prepared to do an OBC reset command."

Next week both N4HY and NK6K will return from Surrey and the first order of business will be to go over all the diagnostic memory dumps to be sure it was indeed the watchdog that timed out. AMSAT-NA asks hams all over the world to please be patient once more as DOVE will surely return to two meters soon.

When DOVE resumes two meter transmissions, it is an indication that battery management is once again under OBC control and it is important to characterize battery behavior for several days thereafter. Amateurs worldwide are requested to collect DOVE telemetry and send it on diskette to the AMSAT-NA Telemetry Archive managed by Reid Bristor, WA4UPD, 4535 Deerwood Trail, Melbourne, Florida, 32935, U.S.A.

WO-18 VIEWS TOTAL ECLIPSE

HR AMSAT NEWS SERVICE BULLETIN 209.02 FROM AMSAT HQ
SILVER SPRING, MD JULY 28, 1990
TO ALL RADIO AMATEURS BT

WEBERSAT passed through a total solar eclipse which occurred on 22 July 90 from 0152 to 0412 UTC at about 0243 UTC. Whole orbit type data and pictures were taken during the event in which it is thought that the satellite passed through both penumbra and umbra of the moon's shadow. These data are being transmitted in the WEBERSAT data stream for several days so that interested users will have ample opportunity to collect it.

WEBERSAT controllers are very pleased with the results; solar array currents measured during the eclipse period do indeed show measurable reductions at the expected times.

Further information on this particularly interesting WEBERSAT event will appear later in ANS and AMSAT publications.

SILVER SPRING, MD JULY 28, 1990
TO ALL RADIO AMATEURS BT

Four Special Callsign Stations to be Heard on AO-10 and AO-13

OSCAR enthusiasts from Zimbabwe have organized a special satellite activity month celebrating "1990: THE YEAR OF THE AMATEUR SATELLITE". Z21HJ/R and Z21GH along with the active support of the Zimbabwe Amateur Radio Society are sponsoring four separate satellite stations operating from four different locations around Zimbabwe. These stations have been issued the call-signs: Z21SAT, Z22SAT, Z23SAT and Z24SAT (prefix hunters should find some interest in these calls). It is expected that the stations can be found on Mode B around the frequency of 145.905 MHz on AO-10 as well as on AO-13.

The stations will be activated over the weekends of 31 Aug through 30 Sept 1990. Special QSL cards will be available for each of the four stations. ANS has been informed that QSLs will be sent either via the bureau or if a speedier reply is desired, the standard DX-QSL protocol of including an IRC will hasten the card reciprocation.

In addition to the special QSL cards, those stations who have worked at least two of the four call signs will qualify for the "ZIMBABWE SATELLITE ACHIEVEMENT AWARD 1990". This beautiful award is based on African culture and shows the famous Victoria Falls in the background. The award will be available for a nominal donation. Further information on QSLing and the award should be available from the stations during the operation.

YET ANOTHER AO13 ORBIT STUDY

HR AMSAT NEWS SERVICE BULLETIN 209.04 FROM AMSAT HQ
SILVER SPRING, MD JULY 28, 1990
TO ALL RADIO AMATEURS BT

Goddard Space Flight Center Experts Study AO-13's Perigee Decay

Tom Clark (W3IWI) and a fellow orbital dynamics expert, Erricos Pavlis of the the Goddard Space Flight Center in Greenbelt, MD have just concluded an in-depth and highly detailed study of AO-13's orbital decay situation. Both Tom and Erricos will present the results of their study in a paper to the AMSAT-NA Space Symposium later this year. While the purpose of this ANS bulletin is not to present the results of their combined efforts in great detail, some of the more outstanding points need to be mentioned to stop needless rumors.

Firstly, AO-13's perigee has been steadily decreasing at a rate of 785 meters/orbit. This was gleaned from studying orbital element sets from the day after AO-13's apogee kick motor was fired almost two years ago. Using a simple procedure of linear extrapolation of the perigee altitude from orbital elements, one would be inclined to predict a orbital re-entry of AO-13 around early 1992. However, life is not that simple. Orbital mechanics is capable of throwing the unwary analyst a celestial curve-ball. Using an extremely sophisticated orbital ephemeris program which includes the effects of everything and the "kitchen sink," and running this program on a large mainframe computer, the results indicate that a simple linear extrapolation technique can not always produce accurate results when it comes to orbital decay. W3IWI's and Erricos's efforts from this huge program show that AO-13's perigee will continue to collapse from the present 1500 KM altitude now to a minimum of 600 KM by 1992. Throughout that year, AO-13's perigee will wander around from 580 to 650 KM. And then just when you thought it would continue to decay, AO-13's perigee will then start to rise again! It will rise to 800 KM by late 1993, and then start to decay again! After staying around 800 KM for awhile, AO-13's perigee will then start to decrease again and a predicted re-entry MIGHT occur around late 1996 or early 1997.

But in all of this, W3IWI asks that hams keep in mind that "the collective effects of gravity of the earth, sun, moon and planets on a highly elliptical satellite do not constitute a neat, simple predictive system -- it is in fact a classic chaotic system ...dependent on the initial conditions." The complete results of this detailed study will be presented in Houston, TX at the Johnson Space Flight Center (JSFC) on Oct. 20th when the JSFC ARC, W5RRR, will host the annual gathering of AMSAT's finest.

RUDAK-2/RS-14 LAUNCH DELAYED

HR AMSAT NEWS SERVICE BULLETIN 209.05 FROM AMSAT HQ
SILVER SPRING, MD JULY 28, 1990
TO ALL RADIO AMATEURS BT

RUDAK-2/RS-14 Launch To Be Delayed Until Autumn

The AMSAT News Service (ANS) has received information from a reliable source that the launch of RUDAK-2/RS-14 has been delayed until Autumn. This delay is due to a hardware failure in the primary payload. The primary payload is a Soviet oceanographic research satellite known as GEOS and RUDAK-2 is riding "piggy-back." In addition to being a packet radio BBS, RUDAK-2 will also contain a Mode B linear transponder. The RUDAK-2 transponder was designed and built by AMSAT-DL and delivered to representatives of AMSAT-U-ORBITA in Munich on January 21, 1990. Accepting the RUDAK-2 transponder on behalf of the AMSAT-U-ORBITA was Leo Labutin (UA3CR) and Dr. Alexander Tenyakchev (UW3CZ).

Originally planned to be launched in June of 1990 on a PROTON rocket from the Pletetsk spaceport, RUDAK-2 is intended for a circular orbit with an altitude of 1000 KM and an orbital inclination of 98 degrees. AMSAT-NA will release further information concerning the launch date of RUDAK-2/RS-14 as soon as it is available.

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 209.06 FROM AMSAT HQ
SILVER SPRING, MD JULY 28, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date UTC	Time	Phs	Mode	NCS	U.S. Day
07 Aug 90	0130	170	J/L	N5BF	Monday
18 Aug 90	0045	170	J/L	N5BF	Friday
28 Aug 90	0100	169	J/L	N5BF	Monday
08 Sep 90	0020	169	J/L	N5BF	Friday

Acting Operations Net Manager, Courtney Duncan, N5BF, is looking for assistance in running the net in the form of a permanent Net Manager and five or six additional net control stations. To volunteer, contact N5BF at:
4522 Ocean View Blvd, La Canada, CA 91011.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Regional Area Coordinator listed below. Pick the Regional Area Coordinator that is closest to you and they can give you a list of other AMSAT Area Coordinators that may be closer to where you live.

AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 209.07 FROM AMSAT HQ
SILVER SPRING, MD JULY 28, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on July 3.

The present transponder schedule for AO-13 is as follows:

```
         Mode-B          : MA 003 to MA 165
         Mode-JL         : MA 165 to MA 190
         Mode-LS         : MA 190 to MA 195  (Mode S Beacon only)
         Mode-S          : MA 195 to MA 200
         Mode-BS         : MA 200 to MA 205
         Mode-B          : MA 205 to MA 240
         Off             : MA 240 to MA 003
         Omni Antennas   : MA 240 to MA 060
```

Cross mode B and S QSOs are possible from MA 200 to 205.

The current attitude estimate:

BLON = 207 and BLAT = +1

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is   LON 24 deg   LAT -9 deg.

Much activity has been heard on AO-10 centering around a popular calling frequency of 145.910 MHz.

I've never seen it at a VE session either, however, Rich, you do know someone who passed his 20wpm that way (3 times, in fact since the FCC didn't issue CSCE's for code credit).

That someone was me. The FCC gave no credit for solid copy at that time, however. You either passed the fill-in-the-blank test or you didn't get code credit. I would not recommend that procedure now that one can pass the exam on solid copy as well as the 10 question test.

Agreed. It is of dubious value to have these questions on the Extra
exam, even if they are "privileges" of holding such a license.

>I have also heard of astronauts without extra tickets being granted

As far as I know NO ONE with a lower class license has ever been turned
down when requesting a waiver to operate from space. I don't think that
an Extra has done so yet.

>perley@trub.crd.ge.com

This is on the Extra class exam for a much more important reason. An

Extra class licensee is authorized to be a Volunteer Examiner-Coordinator or may become accredited to be a Volunteer Examiner capable of giving ANY Amateur Radio license exam. General and Advanced class licensees are allowed to give specific elements only. Each VE should know which elements are used for which license and know whether it is legal for them to administer it. In practice I don't think this is as much of a problem since I think VECs are reluctant to accredit anyone who does not have an Extra Class license (makes it easier when you don't have to worry about who may give what exam).

IMHO the VE accreditation procedure should require potential VEs to learn the element numbers, and not the operator license exams. There are not many more VECs than there are space travelers. But remember, the VECs maintain the question pool so I guess they don't want it that way!

I want to buy a HT for 2 and/or 1 1/4 mtrs with versatile scanning capablility and pl, etc. Unfortunately my present TEMPO fmh HT finally bit the dust. For all its faults, the battery pack lasted pretty well. Ability to access all types of repeaters and long battery life in the scanning modes are most important characteristics. Any recommendations from anyone pleased with the performance would be appreciated along with best liked and worst liked features and where they could be purchased/or prices would be helpful.

I also just bought the Radio Shack PRO-34 scanner, but am not particularly impressed with the operation and lack of a decent case may make a case for the exchange to a Bearcat 200 or just wait for the PRO-2005 to go on sale. I tried to contact Bob Parness, but have lost his net address to see if he had any recommendations on the scanner or the ht. Any assistance would be appreciated, particularly with regard to reviews, personal likes and dislikes, prices and mail order sources of supply.

Has anyone noticed that QST magazine covers often have very interesting covers but *NO* supporting cover story?

I noticed this especially then they had last year's decades of ham radio covers with some very interesting equipment on the covers but absolutely no story describing what was on the cover.

What's going on here, eh?

> connector. To charge the cells you'd use a "parallel" connector (with
> sufficient smarts in the charger to do the job right of charging and
> checking each cell).

You do not want to charge NiCd cells in parallel. You want constant current to charge the cells, not constant voltage. Of course you CAN charge each cell INDEPENDENTLY if you want.

If you are RAPID (or RABID) charging the pack, you need to stop when some cells are topped off, but others may not be full yet.

If you charge cells slowly, you can leave all the cells on charge while the latent ones are still filling up.

Also be wary of connecting cells in parallel in any application. If one cell is FULL and another is EMPTY, such parallel connection could result in a damaging level of current flow between the cells, and a possible fire or explosion as a result of heat buildup.

Just adding more channels to cellular is NOT necessarily going to lower the costs of cellular service.

Consider the case of operating a seaside motel. You have a peak seasonal demand during the summer months, and some business during spring and fall. In the winter things are so bad, you shutdown. But during the peak of summer, you get more than TWICE the number of reservation requests you have to turn down. Would you expand your motel? Suppose the land next door is up for sale. Would you build and addition there?

This addition would be able to service the peak, but would do you no good during the slower spring and fall.

When things are up and down like that, it is not necessarily economical to acquire the resources to satisfy only the peak demands.

Cellular services have these same kinds of peak demands, but they occur at various times of the day. During times other than these peaks, adding more channels is NOT cost effective. While there are some fixed costs in the cellular business (tower and site rental/payments) there are also many incremental costs. To add more channels requires more equipment. There have to be more receivers, more transmitters, more computer interfaces, and more landline connections. For any given market there is a particular number of channels that are the most economically optimal. It isn't always easy to figure this out, but it generally won't meet all the peak demands.

The next question is whether or not this optimal number of channels is greater than the number available in the cellular service. It just so happens that the FCC as set aside some portions of the 800 Mhz land mobile band for undetermined purposes. While morst of these are starting to be taken up, cellular could get a few more slivers. I believe I have read that there is at least one petition to open up some more frequencies and establish a third provider in major markets.

I have been seeing ads in Chicago newspapers in the business sections for very low cost cellular phones. Typically the prices are $200 WITH a hookup and $500 without. They also seem to require the hookup be with a particular provider, so I am believing from this that they are trying hard to get more business. They must believe they are going to make more than $300 for each cellphone sale made, or else have an arrangement to not have to support so much of this discount in exchange for advertising the sellers wares through some other means. It's not clear just what is going on except for the fact that they are trying to get more business.

We've been hearing the problem is a patent issue.

However if it does turn out they delete the cellular frequencies then
I will certainly fuss, complain, and raise hell, and encourage everyone
else to do the same.

Remember, these frequencies are ALSO the 6th harmonic of 2 meters and
the 2nd harmonic of 435-445 Mhz.

One company at least is selling the R1 for 399 pounds.

Did you know that the spec for the R1 in Germany only covers the amateur bands? The R1 in France misses out the English VHF broadcast band - about 97MHz to 108Mhz. I forget the exact frequency range; I have the details at home and also, I believe, the full specs on the R1 and R100. I will look them up.

Reading the recent discussions on repeaters, PL-tone etc, i am puzzled at
the whole idea of 'private' repeaters. Here in UK we do not have any such
beasties; all our repeaters are 'public access' i.e. anyone who can put up
half a second of 1750Hz tone has access to the repeater.
Repeaters are not operated by private individuals here; they are run and
maintained by local repeater groups (who hold the license for repeater
operation). We dont have that many repeaters either (there are only 7 channel
pairs allocated in the 2 meter band for repeater use under our bandplan -
remember us poor Europeans only have 144-146MHz)
I am only able to get three repeaters from my home QTH, there just arent
any more!
This sometimes leads to congestion, but also leads to increased operating
discipline and faster, less timewasting QSOs. It also removes any ghettoising
of particular groups. My question is: Why does anyone want a 'private'
repeater? IMHO a mixture of elitism and one-upmanship?
And *such* a poor use of spectrum-space!

Paul Flaherty comments that EME antennas are pointed above the horizon, thus he says that will reduce interference from SS stations.

My comment is that the first side lobe, say 15 to 30 degrees off the main beam, is usually down about 16 dB from the max gain. Other minor lobes may be down more or less from this number. Thus you can count on no more that another 16-20 dB of isolation from the SS station due to moon elevation. Many people work the moon when it is only a FEW degrees above the horizon. 15-20 dB doesn't make a big dent in the 100-150 dB that may well be needed.

I had a similar problem to one recently discussed; i found a coaxial stub was the answer.
You will need: a 'T' connector for your coaxial feedline, plus a few feet of coax, and some suitable plugs.
Find out the frequency you want to cut off. Convert this to a wavelength (in metres) and divide by four to get the length for a quarter-wave.
Multiply this length by the velocity-factor of the coax you are using (get out your reference sheets, or look in the back of a Handbook).
Most solid-dielectric coax has a v.f. of about 0.66. Foam coax can be nearer 0.8 though, so check it BEFORE cutting!
Make up a length of cable with a plug on the end, to the calculated length. Short circuit the end remote from the plug. Put the coax 'T' piece in the feeder to the radio and attach the stub to the 'limb' like this:

```
  from antenna>-------------------T------------------>to radio
                                  !
                                  !
                                  !
                                  !
                                  !             Stub;
                                  +  <- inner & outer shorted.
```

Tune up the radio and the interference should have gone. If not, try two stubs, spaced 1/4 wavelength apart; this will give you at least 30dB of suppression. Attenuation 10% either side of the stub is less than 1dB.
Note that its perfectly safe to transmit through such a stub too; they make a great way of reducing your 2nd harmonic on 6 meters and preventing you being unpopular with FM broadcast listeners. Stubs are also useful for keeping local despatch companies, Police etc. out of your radio if it has a sleazy, zero-selectivity broadband front-end like many handie-talkies.
Transmitting people can trim the 'limb' of the stub for maximum attenuation (or lowest SWR). Be careful though; there can be some dangerously high voltages on the inner if you run even modest power.

Hey, having a Tech ticket means you can run a microwave mountain-topping
operation. Does that mean the FCC or some other agency is now responsible for
getting you up a mountain? Does the privilege of being trustee of a repeater
mean that someone has to give you a repeater? With an Extra ticket, you get the
privilege of being able to run a space operation without having to get a waiver.
If that's one of the privs, then there have to be SOME questions on the subject.
It doesn't matter if you never use the privilege -- you get it. (And, yes,
all the astronauts have gotten waivers for space operation but that doesn't mean
no Extras have used the privs -- the privilege was defined with an eye toward
satellite operation, and extras have put their callsigns on satellites.

|> Here is a more down-to-earth example. To get a ticket you have to pass
|> various exam elements with designations like 3e, 4a, etc. In a sense,
|> this affects every new ham. Once you get your license, those designators
|> have zero effect on whether you will operate your station legally.

|> Supposedly the reason for the legal portion of the exam is to ensure
|> that you know the rules well enough to operate within the law. What
|> is the point of asking which designators are required for which class
|> license when there are practical questions that won't get in for lack
|> of room?

Another Extra privilege is being able to be a VE. You have to know something
about the tests you are going to administer. Again, it doesn't matter if you
personally don't intend to be a VE -- you get the privilege, so there have to be

questions covering that privilege.

Licenses aren't custom-crafted; you don't get to say, "I'll never use SSTV, but I will run 1,000 watts, but only on HF, and I'll never be trustee of a repeater -- make me a test." You're effectively licensed for life when you get your ticket, and there's no telling what you'll suddenly find attractive. If there's a privilege, there have to be corresponding questions just so the licensing authority can say the test corresponds to the

Then why did they market the R-9000 and R-7000? I don't think ICOM gives one hoot about the ECPA, I think the Uniden story is a lot more credible. I would look for a Uniden/ICOM arrangement that allows sale of the unit here. If the gray market gets them in, Uniden may abandon the suit since it's pointless.

If I could get one gray market, i'd do it. $300 US for that radio is a steal!

> tubes...

Well lets review for a moment. We are discussing protecting a narrow band commercial receiver just outside an amateur band from the emissions of an amateur spread spectrum transmitter. Let's examine a worse case. Assume another amateur system inside the amateur band. Now with a SS transmitter spreading a 20khz voice signal over 20Mhz, one one thousandth of the total power of the SS transmitter will appear in the passband of the narrow receiver. That's a 30db decrease. Now move the receiver outside the band and use a SAW filter on the SS transmitter that has ONLY 60db of stopband. Total power into the receiver will be more than 90db down from the total power of the SS transmitter. If the SS signal is reasonably clean and keeps it's intentional radiation inside the amateur band and the narrow band receiver has any front end filtering at all, we should see better than 100db isolation. This looks pretty good. As for wideband noise generated in the final amplifier, we do use tubes. :-)

As a practical example let's take the Grapes 56k modem. With it's tapped shift register randomizer, it can be considered a somewhat narrow (70khz) spread spectrum source. On one of our sites we have one mounted in the same rack with a narrow band receiver operating 300khz away from it's channel center. We haven't noticed any desense or intermod to the narrowband equipment. We did wind up adding a cavity to the output of the modem, but that was because the narrow band equipment was desensing our modem enough we couldn't copy a weak signal from one of our other modem links.

Now if the SS system is running a lot of power and the narrow receiver is trying to maintain a -140dbm noise floor, THEN we've got a problem. I wouldn't recommend a SS site be colocated with a moonbounce array. Most commercial sites typically want a microvolt or two at their receiver and most proposed amateur SS equipment will run modest

power. I don't think there will be any problems at a well engineered
site. No doubt there will be problems at many of the poorly
engineered sites that I have had the misfortune to use however.
One particular site that I am thinking of has 200 transmitters on
about 2 acres of mountaintop and the best engineered equipment on
the site is in the two amateur installations. We're talking unshielded
cabling, unshielded racks, unshielded PAs(!), mobile units pressed
into repeater service, and even Radio Shack coax on UHF equipment.
With those kinds of problems, they're not going to notice a SS
transmitter.

Gary

And the astronaut-hams who have operated from the Shuttle have had to get a waiver from the FCC because they aren't Extras.

And the hams on Mir got their licenses by radio because they weren't even hams before they arrived in space.

Both groups of space travellers have been very effective communicating over ham radio.

The requirement seems silly doesn't it?

Gary

There is also the small matter of the software to run the machine.
He sure did not have it published. Not even the (software) flows.

In regards to your getting ahold of the hams when you need us, I assume that you are in the Cornell University area, and there are probably many hams there that handle traffic. You can find out who by having someone send a message to you, and then getting the address and/or phone number of the person who telephones you to deliver the message.
(If you dont know of anyone to start a message, please send me your address electronically, and I will send you one.)
Alternatively, you may have a ham club at Cornell, and could find someone through them. Hopefully, the hams have made themselves known to emergency agencies also, so the police, fire, Red Cross, and civil defense agencies can also call on the hams if the need arises.

One of the areas where your argument appears to be quite weak is in the initial response time frame for a widespread emergency. In this case, any "publicly available" resources will be completely saturated by all of the normal users wanting to get on. I am not trying to complain about the phone company or cellular industry here, but to depend on them 100% would be unwise.

It does not follow that adding more spectrum for these services will make them immune from saturation because of the economics of the design of the services themselves. It is simply not cost effective for any communication system to be designed to handle everyone getting on at once for any given coverage area (If they did this, the cost of the equipment would push the rates sky-high, and the competition would take over the business). An example in point is the telephone system. Ma Bell (or Pacific Bell, New England Telephone, etc.) only designs a fraction of the users to be able to get dial-tone service at once. The telephone land-lines could be 100% good, and still if everyone were to pick up the phone at once, people cant talk.

Not only that, but the human response to a problem is to try and get on the system to let people know that you are OK or to request aid. So the human response of the people compounds a capacity problem, with the result of not being able to get through.

In addition to the initial response time being the most problematic to landline telephone and cellular coverage, it is also the most crucial to emergency communications. The initial response period is the period where most of the direct help is provided regarding the immediate safety of life and property, such as: Evacuation notification, Rescuing folks who are trapped by floods, fires, and damaged buildings, Putting out fires, Getting people out of the way of a flood, Providing emergency shelter, food, and clothing, Shutting off energy supplies (gas, electricity) that could cause additional danger if left on in failed buildings, Preventing radioactive, chemical, or biological contamination of remaining food, water, and air, Determination of the extent of the emergency, etc. These are tasks which can not tolerate a "busy" signal, because lives will be lost or property severely damaged.

Once the above tasks are done (or sometimes mostly done), then people working at the disaster site start being concerned about health and welfare traffic, such as "How is my cousin who might have been in the affected area?"

Amateurs fill in the gap nicely. Most people are probably able to get at least a short-distance (VHF) radio going within the initial response time frame (each one fixing their own radio or antenna, rather than everyone waiting for a small team of technicians, who may be responsible for 30 or 40 sites, plus the communications lines or microwave links used to hook them together), and plans have been put in place in many areas to facilitate assisting the emergency agencies through emergency communications.

Now the emergency agencies have their own communications tools, spectrum, and procedures. Use of internal agency bandwidth solves many problems, but hams can help where (a) there is sufficient cross-agency traffic and the radios for the two agencies do not inter-operate (This is VERY COMMON - just a look at all of the differing police frequencies in the country is very convincing that they will probably NOT be able to communicate outside of their own boundaries), or (b) the agency's own radio system becomes overloaded with emergency traffic or inoperative due to the emergency itself.

That is the theory. On the practical side, this argument is also bourne out.

Hams have helped out in many disasters or problems every month, such as Hurricane Hugo in September 89, and the October 17 quake in Northern California, the Earthquake in Mexico City a few years back, etc.

There are also many that are unknown unless someone writes them up. These include the search for a missing girl in Billerica, the putting out of a particularly bad fire at the Naval Air Station in Whidbey Island, the Crash of Avianca Flight 52 in January, a severe ice storm in Feb 90 that knocked out phone, water, and electricity to several counties, etc.

Well, I hope that this has shed enough light on what value ham radio

can be in an actual emergency, and why the commercial providers will not be able to fill the total needs in the immediate response timeframe, that you will reconsider the implications of taking ham radio's bandwidth and giving it to cellular communications. If I personally were in charge of disaster planning for some geographical area, I would want to include hams in the emergency planning process to maximize the safety of lives and property.

Where there is a will, there is a way....

My IC-24AT allows me to enter frequencies in the cellular band when I enable extended receive, but claims that the synthesizer won't lock up in that range. Since it locks up solidly just above this, in the 902MHz band, I wonder if it's just lying to me and was programmed not to allow reception at these frequencies by faking an unlocked synthesizer.

Actually, all you really *need* is either the upper or lower half of the main lobe, ala SSB. Periodically chipped BPSK (and QPSK, for that matter) exhibits phase periodicity at the chip rate (half the main lobe width). But.. the signal processing gets real ugly when you try to generate, transmit, receive, and then reconstruct such a beast. In an application of our type this would only be of interest in a very spectrum-limited situation.

Just in case someone cared...

Thanks, y'all, for the suggestions posted and mailed. Nothing really wonderful popped out but I found a short list of possibles for various occasions. I guess the normal one will be "Mountain Friendly Wireless". "No mountain freeways" is a close second.

With lemons you make lemonade. With a lemon of a callsign I guess you make phonetics. :-)

> Oh, ya, my super-duper, hum-dinger call is -------> WB6WUI

Oh ecch. Uh, "Way Below Six Word Units per Inch"? "We Be Sexy, Whoo-Eee"? Good luck. :-)

QUALIFICATION-BASED LICENSING

The FCC's proposal to create a new no-code class of license may be a useful first step, but it does not go far enough towards addressing the problems with the American amateur licensing structure. The fundamental premise upon which licensing should be based has long been lost; the new proposal is an inadequate step towards reclaiming it.

When someone applies for a driver's license, the state tests them on both written knowledge (of the rules of the road) and practical skills required to drive a car. When someone applies for a private pilot's license, the FAA tests them on both written knowledge and practical skills required to fly an airplane. When someone applies for admission to the bar in order to practice law, the Bar Examiners test them on knowledge of the law. These candidates are not tested on repairing magnetos, celestial navigation and golf. They are tested on the skills required to safely and competently use the privileges granted.

Yet the amateur radio licensing debate has almost never even mentioned this fundamental concept. Instead of testing applicants on required skills and knowledge, applicants are expected to learn various the arcana of theory and (at least today) Morse Code. While some of these are directly relevant to the field of amateur radio, the actual license classes do not grant privileges in line with the tested skills. The current "incentive" licensing structure has become capricious, granting access to a public resource -- the spectrum -- based upon a general level of knowledge largely irrelevant to the privileges granted. Instead, privileges are granted as a reward for learning what the system believes should be learned. The spectrum has become a Merit Badge. Is this the type of structure that can withstand increasing scrutiny and pressure from other applicants for spectrum space?

I would like to propose, then, that once the dust settles on Docket 90-55, we readdress the entire licensing structure with an eye towards making amateur radio more attractive to newcomers, while ensuring that the airwaves are only open to those who, like pilots in the sky, have demonstrated the requisite competence to use them as they do. This means that licensing should be simpler, both in structure and in requirements. But not only the requirements to obtain licenses, but the privileges granted to licensees, should be revamped.

The present proposal (FCC 90-55) seeks to reassure the existing amateur community that all existing privileges will be retained. This is a politically useful goal for the short term, but it stifles any possibility of creative change. Are we willing to allow a few privileges to be taken away from some amateurs, in exchange for others? If we think not, then what if it is necessary in order to create a positive growth rate, as may be needed to preserve our spectrum?

Amateur Radio should be inclusive, not exclusive

Much of the support for a no-code license seems tempered with a twinge of guilt: No-code is only acceptable, many of us have said, if it is accompanied by a more difficult theory examination. This seems to be a defensive view, designed to defend against claims that we are "giving away" too much, or opening up our bands to the "riff raff". Visions of the eleven meter mess are invoked, as if the only difference between CB and ham radio were the code.

But it is wrong to condemn CB! While only a few hundred thousand Americans hold amateur licenses, several million are squeezed onto forty channels, forced to use AM emission, with sporadic-E skip adding to the chaos. It only takes a few bad apples with illegal power and zero courtesy to create a mess. Does this mean that everyone on that band is bad? Is everyone in a neighborhood guilty of the crimes of one neighbor? Of course not. CB was destined for chaos by its poor design. Millions of CBers are well-mannered and desire the same kind of orderly bands that we like to imagine that we have (although that claim is often hard to justify). They just aren't given an adequate opportunity to join us.

I propose that we replace our current "incentive" licensing structure with a more modern "qualification" based system. The premise is simple: Each license class can be achieved by demonstrating the knowledge required to use the privileges it grants, no more, no less. This is only tempered by the expediency of keeping the structure simple and thus limiting the number of classes.

Just as we had only three classes during the 1950s and early 1960s, when amateur radio had it biggest growth years, we can survive on three basic classes today. They just need to be modernized -- radio isn't what it was in 1950, or in 1966 when Incentive Licensing was decided.

Entry-level requirements

An entry-level license is a marketing tool. It should be easy enough to earn that potential applicants are not repelled, yet should be difficult enough to guarantee that its privileges are understood. The traditional definition of the Novice written examination seems to be proper: Amateur radio regulations and sufficient theory to understand them. Not an engineering degree. Not advanced mathematics. Not digital communications expertise. Just enough theory to understand how to operate an amateur radio station within the rules. This Novice examination should include basic operating practices, simple electronics (Ohm's law, electrical safety, etc.), and relevant regulations. The number of questions is irrelevant if the pool is large enough, but a 30-question multiple choice examination seems about right.

The existing Novice privileges are not selling. Thirty years ago, the ability to "work the world" on the HF bands was a selling point, but today it's possible to dial up a telephone call to Paris or Sydney. CB and cellular telephones have taught people that chatting on a radio can be fun. This type of activity is mostly on the VHF bands. So the entry-level ticket can be a VHF license, like the proposed Communicator, and of course should be codeless. It should be easy, because it serves a marketing function, and relevant to the privileges earned. Start with the current Novice written exam, modified for more VHF emphasis. And stop before it gets harder!

These licensees should not be "ghettoized" in narrow bands where they are not exposed to mainstream amateurs. The Novice-level license should be allowed on all VHF and UHF bands, especially the popular FM and digital frequencies. They should not be allowed to operate in the small areas used for weak-signal operation, which requires a higher degree of skill. But how much theory does it take to operate an FM transceiver? Not much. Qualification-based licensing reflects that. It also means that a Novice, with little knowledge of the dangers of VHF power, should be limited in power. The current Novice limits seem sensible -- 5 watts on microwaves (902 and up) is plenty, while somewhat higher power levels are adequate for most voice and packet operation. Modes should also be unrestricted; a Novice should be allowed to use any mode that is permissible within the authorized frequencies. This does not include the right to own a repeater.

Does the entry-level ticket need HF privileges? Perhaps, but here we can see some reasoning for requiring the code. A no-code Novice can thus be granted HF privileges (say, the current Novice ones) for passing a 5 WPM code test. The FCC can simplify this by using a CSCE process, so long as the applicant need not use the suffix (i.e., /KN) after the FCC has been given sufficient time to update its records to reflect the endorsement (say, 30 days).

General license

The next license will grant general HF privileges, so it can be called the General. Morse code is less important today than it used to be, so a 5 WPM code test is adequate -- if someone wants to use CW, they'll learn to go faster! The General written exam should be harder than the Novice, as it needs to cover more HF propagation, additional operating procedures, and more theory needed to understand these additional privileges. Today's Technician and General exams have the right idea, though it seems unnecessary to have separate VHF and HF elements. Let's go back to the level of the 1960's Technician exam, which had the General written exam and a 5 WPM code test. Current Technician and General licensees can be merged into this one class, further simplifying the system.

What privileges does this new General earn? With a modest technical background but a general understanding of the Amateur service, all bands and all modes seem appropriate. But almost every country that has multiple license classes, outside of the United States, recognizes that high power operation requires a higher degree of knowledge and skill. The General can thus be power-limited to, say, 250 watts PEP output, after a transition period. But it gains larger sub-bands, today's Advanced level, in return.

One higher class

A few sub-bands may still be reserved for the highest class. Again two existing classes can be merged here. The misbegotten Advanced, created for the 1966 Incentive Licensing program, can be merged with the Extra. This can be earned via the current Advanced examination (13 WPM with additional theory beyond the General); all existing Advanced licensees thus gain Extra privileges. In addition to the right to run maximum legal power, the top class can still have some small sub-bands reserved for it, along the lines of today's Extra bands. The higher code speed is, after all, relevant to the type of DX operation pursued in the Extra sub-bands; the greater theory is relevant to high-powered operation.

Perhaps an "Extra" license class can be preserved, complete with a 20 WPM code test. But it needn't be the FCC's! In reality, the top rung of the Incentive Licensing ladder is more of a Merit Badge than a credential. Perhaps the ARRL or some other organization can give it out as an earned award, valued for bragging rights and wallpaper value, just as it was before 1967. And if call sign assignment is ever privatized, the Extra holders can stand on the front of the line.

The names of some licenses may need to be addressed too, to avoid inappropriate connotations. "Novice" implies temporary. But it no longer is temporary, and an entry-level license need not be. If you're qualified, you're qualified! "Communicator" carries baggage of its own. And what about the Morse-endorsed version? Novice Plus? It may be close to today's Technician in privileges, but when that name was introduced in the 1950s, it was meant to imply that its holders were well versed in the arcana of then-obscure VHF lore. In some countries, a codeless VHF ticket is called "Class B". This or some other neutral name may be most appropriate for the entry-level ticket. An endorsed one can be nicknamed "B Plus". (Maybe old tube fans will get a charge out of it.) "General" and "Advanced" are sufficiently neutral terms to keep for the higher classes.

In summary, we end up with three and a half license classes:

1) Class B - No code, easy test. Most VHF privs, power-limited.
1.5) Class B + 5 WPM - Class B plus current Novice HF privs.
2) General - 5 WPM plus General written test. 250W, all bands except current Extra sub-bands.
3) Advanced - 13 WPM plus Advanced written test. All privs.

Current Novices become Class B+, current Technicians get the General, and the Extra is grandfathered as a "merit badge" class.

This simplifies the licensing structure, puts privileges in line with the examinations, and provides a marketable entry-level license. Most current licensees gain privileges. The only major loss, to today's General and Technician classes, is to the power limit, and both gain frequencies in return. Incentive Licensing was a disaster. Perhaps Qualification-based licensing can begin to undo the damage.

Does anyone have experience using the 6 meter ham band
for radio control boats or aircraft? I know there are
some freqs like 50.1 50.2 etc that we can use. Can
manufacturers of this equipment be easily found?

Please reply via Internet email.

Thanks, 73 de Rick

Re: NICAD CELL CHARACTERISTICS

I've heard a theory that "memory" is the product of two modes of misuse - not completely discharging the cell, then overcharging the cell. While not disagreeing with an excellent article, I'm offering another remedy for vanquishing the "memory effect": don't overcharge to the point that it heats up the cell.

I'm not particularly attached to this theory, and wouldn't mind hearing substantiating or contrary evidence. Note that most commercial cell-boilers with Temp Cut Off thingies overcharge a cell.

>in that range. Since it locks up solidly just above this, in the 902MHz
>band, I wonder if it's just lying to me and was programmed not to allow
>reception at these frequencies by faking an unlocked synthesizer.

Since this made the rounds I've gotten several pieces of mail from people whose 24AT's WILL lock up in those frequencies. Mine must be a funny one, I guess. My hypothesis that the 24AT might be programmed to not receive the cell band was reinforced by the fact that mine also loses lock at EXACTLY 451.00MHz and regains it at EXACTLY 500.00MHz, thus very elegantly excluding the UHF public service (i.e. police) frequencies.

Obviously I'm wrong and my radio is just being fascist all by itself. Thanks for the corrections.

> transmit, receive, and then reconstruct such a beast. In an application of
> our type this would only be of interest in a very spectrum-limited
> situation.
>

I may have said something misleading there in my $.02 worth.

What I said is true for BPSK because the amplitude of the spectrum
is symmetric about the carrier. Thus, with symmetric amplitude and
periodic phase, half the main lobe gives you everything. QPSK, while
having the same phase period, does not necessarily have symmetric
amplitude. You still need the whole main lobe for that. :-[

Possible application: additional diversity. If your main lobe is too
junked up by all those spectral co-users, then maybe one half of the main
lobe, by itself, is OK.

> KNOW what happens to the cellular services in these situations. Would
> you be willing to share your tales?

As I remember, the cellular system was operating, although overloaded and slow like the rest of the network.

However, cell phones are not a good choice for use in a widespread emergency anyway, especially around the SF Bay Area. Why?

1) If one is making a call from a cellphone to another cellphone in the same cell, the signal is routed only through that cell site repeater. But if the call is to ANY other cell or to ANY wireline telephone, and this means the vast majority of calls, then the signal is routed to cellsite #1, then to the cell hub either by microwave link or by phone trunk, then to the wireline network or to cellsite #2, as appropriate. That's a bunch of places to fail; probably more than if the call went twisted pair the whole way.

   If the cell hub CO goes down (or the uwave dish is thrown out of aim), all the users of that whole system are out of luck. If a cell site fails or loses a tower, you'd have to find a working cell somehow and hope it wasn't swamped.

2) There are two cellular providers in the bay area, as for other places too. I have heard (from someone whose job is to care about

these things) that both the system hubs are in places that are not considered seismically safe: one is on an upper floor of an old building in Oakland, and the other is in a liquefaction zone somewhere else in the east bay, from what I understand.

3) As has been pointed out before, these people are not in the game for public service. They are in for PROFIT. The law of that game states that service in adverse conditions is fit to be provided only if the revenue to come from it times the chance of it happening is greater than the cost of preparing for it. Does an earthquake-tolerant cell phone system qualify for this? Probably not for a big shaker, I would guess.

COME ON... the R7000 went on the market before all the fuss started
about being able to receive cellular on wideband scanners. I would
bet Icom has not had a production run of R7000's in a few years, and
probably never will again.

I'd much rather they crank out some IC-3GAT's, IC-338's, and that
all magical whizbang 28/50/144/220/420/902/1240 Mhz multi-mode HT.

The R-9000 is too expensive a radio for the cellular industry to get
worried over. They are more worried about "everyone" having receive
capability of cellular frequencies than in hos sophisticated the
receive capability in this band of a few.

The R-7000 is a pointless case, because it is probably out of production
forever now.

> right to own a repeater.

I'd suggest between 25 and 50 watts for 50 through 450 Mhz, and 10 watts
up to 3 Ghz, and 1 watt above that. A major reason for this is simply
the plethora of rig models already in these power ranges.

Take note that the current Novice Enhancement privileges allow 5 watts
on 1270-1295 Mhz, but all the rigs are either 1 watt (HT's) or 10 watts.

rewrite: This does not include the right to own a repeater.
into: This does not include the right to operate a repeater.

Tsk, tsk, Don. As a ham you should know that using radio receivers within a commercial air transport (without permission of the pilot in command) is verboden by the FAA. Potentially dangerous to nav/com avionics on board.

A small chuckle once again, as yet another New Yorker/New Jersyite discovers that southern California really *is* a mobile society. Yes, we've used up all the cellular bandwidth, as well as *all* the available Land Mobile bandwidth below 1 GHz. Everybody out here has mobile two-way; about every third vehicle on our freeways has a non-broadcast antenna of some sort on it.

I truly wish the rest of the country believed us when we say that we know what massive spectrum congestion is all about.

It probably won't simplify things since recording CSCE data like this is a new and different procedure they've never done before. It would probably be best to just have a distince class.

```

Here's where you've slipped up, Fred. I think I know you well enough to believe that you surely didn't intend this.

```
> In summary, we end up with three and a half license classes:
>
> 1)        Class B - No code, easy test.  Most VHF privs, power-limited.
> 1.5)      Class B + 5 WPM - Class B plus current Novice HF privs.
> 2)        General - 5 WPM plus General written test.  250W, all bands
>                 except current Extra sub-bands.
> 3)        Advanced - 13 WPM plus Advanced written test.  All privs.
>
>         Current Novices become Class B+, current Technicians get the
>         General, and the Extra is grandfathered as a "merit badge" class.
>
> This simplifies the licensing structure, puts privileges in line with the
> examinations, and provides a marketable entry-level license.  Most
> current licensees gain privileges.  The only major loss, to today's
> General and Technician classes, is to the power limit, and both gain
> frequencies in return.  Incentive Licensing was a disaster.  Perhaps
> Qualification-based licensing can begin to undo the damage.
```

So what do I need to do to earn high power privileges? I have to learn to learn something totally irrelevant to those privileges: Morse Code. Not only that, but I have to go up to 13 WPM.

I don't mind having a more technical exam to get high power privilege, and as a Tech now, I don't even mind having to go back and take a new written exam to regain it.

But I just cannot support something that requires me to pass a Morse Code test for ANY privileges that are not relevant to code, especially as they apply to frequencies above 50 Mhz.

Fred, I believe you're heading in the right direction with this, but just have stumbled with this particular one. Let's keep working on it, though.

In article <1105@ke4zv.UUCP> gary@ke4zv.UUCP (Gary Coffman) writes:
]Well lets review for a moment. We are discussing protecting a narrow
]band commercial receiver just outside an amateur band from the
]emissions of an amateur spread spectrum transmitter. Let's examine
]a worse case. Assume another amateur system inside the amateur band.
]Now with a SS transmitter spreading a 20khz voice signal over
]20Mhz, one one thousandth of the total power of the SS transmitter
]will appear in the passband of the narrow receiver. That's a 30db
]decrease. Now move the receiver outside the band and use a SAW filter
]on the SS transmitter that has ONLY 60db of stopband. Total power
]into the receiver will be more than 90db down from the total power of
]the SS transmitter. If the SS signal is reasonably clean and keeps
]it's intentional radiation inside the amateur band and the narrow
]band receiver has any front end filtering at all, we should see
]better than 100db isolation. This looks pretty good. As for wideband
]noise generated in the final amplifier, we do use tubes. :-)

Err... first of all, probably we are spreading at less than 1000:1 - certainly if we are on 2 meters. Second, if the SS system is radiating 100W ERP (not unreasonable power), we are looking at +50dBm. So, take your 100 dB of isolation, and you are looking at -50dBm of noise into your narrow receiver. That's a LOT of power! As I was pointing out, you need a large amount of isolation.
]

]As a practical example let's take the Grapes 56k modem. With it's
]tapped shift register randomizer, it can be considered a somewhat
]narrow (70khz) spread spectrum source. On one of our sites we have
]one mounted in the same rack with a narrow band receiver operating
]300khz away from it's channel center. We haven't noticed any
]desense or intermod to the narrowband equipment. We did wind up
]adding a cavity to the output of the modem, but that was because
]the narrow band equipment was desensing our modem enough we couldn't
]copy a weak signal from one of our other modem links.
]
Specifically, 70kHz is narrow enough to allow running it through a
cavity, which you did. That adds a lot of isolation. In fact,
running 56 kB through 70 kHz is nowhere close to "spread spectrum" -
you are running slightly over one bit per Hz. I would expect
real spread spectrum to be way down from that.
]Most commercial sites typically want a microvolt or two at their
]receiver and most proposed amateur SS equipment will run modest
]power. I don't think there will be any problems at a well engineered
]site. No doubt there will be problems at many of the poorly
Around here, more like .5 uV, which is -113 dBm, with site noise
around -118 to -122.
]engineered sites that I have had the misfortune to use however.
]One particular site that I am thinking of has 200 transmitters on
]about 2 acres of mountaintop and the best engineered equipment on
]the site is in the two amateur installations. We're talking unshielded
]cabling, unshielded racks, unshielded PAs(!), mobile units pressed
]into repeater service, and even Radio Shack coax on UHF equipment.
]With those kinds of problems, they're not going to notice a SS
]transmitter.
That sort of transmitter density is normal around here, but unfortunately
it is frequently the amateur who has the worst installation. We do our
best to combat this, through forest service inspections, and
coordination technical requirements.
]
]Gary

This practice can be very dangerous. Take precautions and wear
safety glasses. I have seen capacitors explode when used in
this manner. I haven't personally seen a battery explode, but
I wouldn't be surprised if it happened. Now I do use this technique,
but please be careful.

>to those genuinely interested in DX (rather than awards) and/or ragchewing.

Unfortunately the word doesn't seem to get out to the DXers that a station does not play the DX game. Thus every time he gets on the air he becomes the victim of a pileup. This leaves a very bad impression with many operators and they QRT permanently. Since most of the rabid DXers seem to be US based, this gives the US a black eye.

Since DXing is a form of contest operation, restricting contacts that count toward awards to six contest weekends a year makes a lot of sense. The operator in a rare country can get on the air the rest of the year and enjoy his hobby in peace. Those who like to talk to distant places, as opposed to the contest style operators, will be able to work the rare ones in a meaningful way without the insane pileups.

Wayne has finally come up with a good idea. If this is implemented, I might even get back on HF more frequently. As you might guess, I am not a contest operator and enjoy actually talking with people in other lands.

Whoa there..... The lower end of six is the province of the DXers.
For example 50.110 and 50.125 are SSB calling frequencies, and CW/SSB is
common up to at least 50.200 +.
If you value the health of your model, you will choose more conventional
model-control frequencies on 6. For example the ARRL Bandplan now talks
about 50.8 -51.0. Traditionally model control has been up in the 53 + region.

I can't suggest specific equipment, sorry.

Here are some of my 90-55 comment tidbits:

In FCC Docket Number 90-55: [I use CAPITALIZING to highlight here]

    >   IV. PROPOSAL
    >
    >   15. We believe that the petitions have merit. Further, like
    > the petitioners, we believe that this is a propitious time to
    > propose the establishment of a codeless license, given the
    > advances in electronic communications in the past few years. We
    > propose, therefore, to establish a codeless class of amateur
    > operator license, the Communicator Class. With respect to this
    > proposed operator class, we have established three objectives.
>>>>> OUR FIRST OBJECTIVE IS TO OFFER AN ENTRY LEVEL LICENSE
>>>>> OPPORTUNITY TO ALL PERSONS WHO FIND THE TELEGRAPHY REQUIREMENT A
>>>>> BARRIER TO PURSUING THE PURPOSES OF THE AMATEUR SERVICE. Our
    > view is best expressed by the statement of the ARRL that "THE
>>>>> GOAL OF THE CODELESS AMATEUR LICENSE IS TO BRING SUCH LICENSEES
>>>>> IN TO THE 'MAINSTREEM' OF THE AMATEUR RADIO SERVICE, AND TO
>>>>> ENCOURAGE THEM TO UPGRADE THEIR LICENSE CLASS."(51) Our second
    > objective is to propose a type of license that can be implemented
    > quickly if a decision is made to proceed. Our third objective is
    > to avoid any negative effect upon current licensees, upon the
    > work of the volunteer examiners, or upon the Commission's

The above statement suggests that the Communicator class will be an ENTRY
level license class, but the PROPOSAL to remove the Technician class for
future licensing is a CONTRADICTION. To where is the Communicator expected
to upgrade?

    >   17. Operator license structure. In proposed Section 97.9,
    > we would incorporate the Communicator Class in a simplified
    > license structure containing four ascending steps: Communicator,
    > General, Advanced, and Amateur Extra Classes. Current Technician
    > and Novice Class operator licenses would be grandfathered
    > indefinitely. There would be no new licenses issued for those
    > license classes, but existing licenses could be modified or
>>>>> renewed. THIS APPROACH WOULD MEET THE OBJECTIVES WE ESTABLISHED
>>>>> IN PARAGRAPH 15. Dennis and Linda Welch, John McCord and SCATG
    > suggested preserving the five-step ladder by eliminating the
    > telegraphy examination requrement from the Novice class license.

The FCC has **NOT** establish any connection whatsoever between the
objectives in paragraph 15, and the concept of removing the Technician
or Novice license classes from future licensees. It has been suggested

this move is REALLY to reduce the burden on the FCC in processing upgrades. I say keep the TECHNICIAN class and remove some other class, or better yet just clean up the whole licensing structure.

```
    >     18.  For future licensees, the Communicator Class license
    > would be the first step in the license structure instead of the
    > Novice Class.  Our premise is that most newcomers to the service,
    > given the choice, would elect to qualify for the Communicator
    > Class license rather than the Novice Class license.  There would,
    > therefore, no longer be a need for the Novice Class license,  We
    > particularly invite instructors, volunteer examiners (VEs), and
    > VECs to submit comments on the validity of this premise,
    > including factual information on the time and effort that would
    > be required for persons to prepare tor the proposed 60 question
    > Communicator Class written examination as compared to the time
    > and effort currently required for the Novice Class 30 question
    > written examination and telegraphy examination.
```

The FCC **FAILS** to address the issue of what the NEXT STEP that new licensees will be expected to follow (if any).

```
    >     19.  Because the written examination for the Communicator
    > Class license would be more comprehensive than that of the
>>>>> Technician Class license, THE COMMUNICATOR CLASS WOULD ALSO SERVE
>>>>> IN THE STEAD OF THE TECHNICIAN CLASS FOR FUTURE LICENSEES.  Each
    > step in the proposed four step structure provides recognition
    > that the holder has significantly advanced his or her skill in
    > both the communication and technical phases of the radio art.(56)
    > This structure could be rapidly implemented.  The present license
    > application processing system and license application form would
    > continue to be used.(57)
```

The HIGHLIGHTED portions of paragraph 19 above and paragraph 20 below are in DIRECT **CONTRADICTION** !! The Communicator class CANNOT "serve in the stead of the Technician class" if it does not have ALL privileges above 30 Mhz as the Technician class now has.

```
    >     20.  Operator Privileges.  The proposed control operator
>>>>> PRIVILEGES OF THE COMMUNICATOR CLASS WOULD GENERALLY BE THOSE
>>>>> SUGGESTED BY THE ARRL.  The privileges would include all
>>>>> authorized emission types.  THE PROPOSED TRANSMITTER POWER
>>>>> STANDARD WOULD BE 200 WATTS PEAK ENVELOPE POWER.  The licensee's
    > station would be eligible for a Group D call sign.(58)  Stations
    > with Communicator Class control operators would not be permitted
    > to transmit on the 2 m and 6 m bands.  In view of ARRL's desire
    > to bring the codeless class into the mainstream of the amateur
    > service,(59) however, we particularly invite comment on the
    > effect of excluding Communicator Class licensees from these two
    > popular bands.
```

```
    >     21.  The ARRL stated that one premise for its petition was
    > that an accommodation should be made for codeless class licensees
```

> to upgrade their license class. It cited countries that have
> codeless licenses where the written examination tests the
> examinee's technical qualifications. The ARRL stated that
> amateur service societies in countries such as Australia, the
> Federal Republic of Germany, and Belgium report ongoing
> telegraphy activities among the codeless class licensees working
> to upgrade the license class.(60) While the proposed
> Communicator Class privileges include telegraphy on the 1.25
> meter and shorter wavelength bands, we recognize that telegraphy
> operation is more closely assiciated with the HF bands. The
> opportunity for newcomers to the amateur service actually to send
> and receive messages in the Morse code on small segments of the
> HF 80, 40, 15, and 10 meter bands is provided to the Novice and
> Technician Classes so that those operators can gain an
> appreciation of telegraphy tand acquire the proficiency needed to
> pass the telegraphy examination for the General Class operator
>>>>> license. WE SPECIFICALLY REQUEST COMMENTS, THEREFORE, CONCERNING
>>>>> THE DESIRABILITY OF INCLUDING THE OPPORTUNITY FOR COMMUNICATOR
>>>>> CLASS LICENSEES ALSO TO EXPERIENCE ON-THE-AIR TELEGRAPHY
>>>>> OPERATION ON THE HF BANDS. In view of our obligation under the
> provisions of the international Radio Regulations,(61) if it is
> desired, only domestic communications on the HF bands would be
> authorized.

If you add HF privileges to Communicator WITHOUT a code test, then what is the difference between that and just taking away the code test from the TECHNICIAN class requirements? NONE!

Not that such as a bad idea, but why both even creating Communicator. Just remove the code test from Technician and improve the written exam and stop there. We don't even need Communicator is this case.

>   22. Under proposed Section 97.301(g), a Communicator Class
> licensee who passes, or otherwise receives credit for a
> telegraphy examination, would be authorized the additional
> privileges of the Technician Class.(62) To avoid a license
> processing burden, however, the documentation of the passing of,
> or credit for, a telegraphy examination would be evidenced by the
> Certificate of Successful Completion of Examination (CSCE) issued
> by the administering VEs,(63) rather than by the issuance of a
> Technician Operator license. Theindicator used by the
> Communicator Class for identification purposes would be AC.(64)
> Under propsed Section 97.505(a)(1), VEs would be authorized to
> grant examination credit, evidenced by a CSCE, to a Communicator
> Class examinee for the slow speed telegraphy examination when the
> examinee holds a Novice Operator license.(65) That combination,
> Communicator Class license and CSCE, would permit the
> Communicator Class licensee the same rights and privileges of the
> Technician Class operator. The VECs would provide listings, in
> paper or magnetic for, of the Communicator Class licensees who
> have been issued the CSCE.

This would require the Communicator with code to constantly sign that annoying suffix **FOREVER**!!

In addition, there would be almost NO opportunity for other amateurs to verify the validity of a Communicator licensee using such an indicator on bands earned by passing only a code test.

I even suspect that the FCC doesn't even have the authority in the Communications Act to do this.

```
    >     23.  Volunteer examiners.  The instant proposal contains
    > substantive changes in the amateur operator license examination
    > procedure and the issuance of amateur operator licenses and
    > CSCEs.  All operator license examinations would be administered
    > under the VEC system.(66)  The additional task of administering
    > the Communicator Class would be offset by the elimination of
    > other tasks, included the discontinuance of the two-examiner
    > system for the Novice Class license.(67)  The coorination and
    > oversight by the VECs provide more credible results than does the
    > two examiner system.  In the latter, examination administration
    > errors are more common and cheating is a greater problem than in
>>>>> the VEC system.  THE TASK OF ADMINISTERING NEW TECHNICIAN
>>>>> OPERATOR CLASS LICENSES WOULD ALSO BE DISCONTINUED.(68)  The
    > Novice and Technician written examinations would no longer be
    > prepared and adminsisted as separate examinations.  The VEs and
    > VECs, moreover, coulb e reimbursed for out-of-pocket costs
    > incurred in connection with all examinations.(69)

>>>>> (68)  Some 10,000 to 15,000 persons qualify for the Technician
>>>>> Operator Class license annually.
```

Apparently the FCC wants to eliminate the workload involved here, but in so doing will be creating a class of outcasts who will perpetually be appearing to be waiting for a license to arrive.

--Phil Howard, KA9WGN-- | Individual CHOICE is fundamental to a free society

I have not seen this mentioned yet, but the FCC proposal 90-55, if adopted as is, would eliminate the 220-222 Mhz band IMMEDIATELY, rather than later on when service rules for land mobile services are adopted.

I think the aforementioned article would be better titled "A Microcomputer-Controlled NiCad-Battery DIScharger." If you look closely at the schematic, especially the interface between figs 1 and 2, you will note that there is no direct path between the constant current source and the battery, and furthermore the MOSFET pass transistor is bridged across the battery terminals.

I would also recommend heatsinking regulator U11, as its output is shorted directly to ground.

In other words, do not try to build this device from the QST schematic...

Phil

John,

You're quite right, protecting a nearby user on a frequency next to a spread spectrum transmitter could be difficult. I can't offer much advice since I don't have any actual experience with spread spectrum, but I can say that most of the systems I've read about seem to operate above 1 GHz and are not operated from fixed locations where EMI would be a problem.

Maybe somebody else out there can relate some practical experiences?

Phil

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
10-11	International Designator (Last two digits of launch year)
12-14	International Designator (Launch number of the year)
15-17	International Designator (Piece of launch)
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Julian Day and fractional portion of the day)
34-43	First Time Derivative of the Mean Motion or Ballistic Coefficient (Depending on ephemeris type)
45-52	Second Time Derivative of Mean Motion (decimal point assumed; blank if N/A)
54-61	BSTAR drag term if GP4 general perturbation theory was used. Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63	Ephemeris type
65-68	Element number
69-69	Check Sum (Modulo 10) (Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
09-16	Inclination [Degrees]
18-25	Right Ascension of the Ascending Node [Degrees]
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee [Degrees]
44-51	Mean Anomaly [Degrees]
53-63	Mean Motion [Revs per day]
64-68	Revolution number at epoch [Revs]
69-69	Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

```
NOAA 6
1 11416U          86 50.28438588 0.00000140           67960-4 0  5293
2 11416  98.5105  69.3305 0012788  63.2828 296.9658 14.24899292346978
```

Note that the International Designator fields are usually blank, as issued in the NASA Prediction Bulletins.

Donald P Perley (crdgw1!galaxy@uunet.uu.net) on 29 Jul 90:

>If you get the same number of customers/channel, it will be just as crowded
>no matter how many channels, so where is your lower cost?

How that works is a mystery to me too... I think it has to do with fractions, something I've never been good at, but if you take the *fixed* cost of some items (ie, towers) and divide it among a *greater* number of customers, you end up with a *lower* cost... So, there may be the same number of customers per channel as before, but not the same cost per customer... get it?
What's keeping my cell company from serving more customers is the availability of channels (spectrum, that limited resource a chunck of which is allocated to you). So, by not getting the lower cell rates that I could, I am *indirectly* paying for your hobby/service.

>   Am I willing to pay for your cellular service through
>the loss of spectrum?

You ARE paying. In case of an emergency, you're doing nothing but "pay back" for the privilege extended to you during "normal" times.
In other words, your exclusive use of a limited resource (spectrum) is payed for when the emergency arises, in the form of 'public service'.
Whether I'm willing to take advantage of your service or not, that's another story. In the case of my cousin, last fall I chose not to collect, for "reliability" reasons... not the "technical" reliability of the signal going through autopatches, around mountains, etc, but the reliability of the *message itself*...

>Whats the matter, would she lie to me?

No, but *you* may... unwillingly, of course... :*>

Like <zaphod.mps.ohio-state.edu!mips!wyse!stevew@tut.cis.ohio-state.edu>
(Steve Wilson x2580 dept303) writes on 25 Jul 90:

>Now that may cast into question the entire effort we exert with
>an admission that it's possible to get inaccurate information.

...and all the discussion that went on a few days back on the "accuracy" issue.

On a last note: how come I'm getting *my* posting AND a reply to it IN THE SAME DIGEST..? Do certain groups get special delivery..? Any comment, Brian?

RTTY DX Notes, 1of3, 7/27/90

RTTY DX Notes for Weekending 27th June 1990.
Part 1 of 3.
BID: $RTDX0727

One wonders at times about the accuracy of the propagation reports. It seems that WWV gives a letter that says the bands will be fair to good, W1AW reports that the bands will be good this week, but by the looks of the bands, everyone has gone out to play golf or tennis or something, because there have been very few stations on the air in the past week. Or maybe they have been checking their gear for the next contest.

Our information this week came from F8XT, I5FLN, I5ICY, I5IGQ, JA1BLV, OD5NG, SM5EIT, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your help.

RTTY DX Notes, 3of3, 7/27/90

RTTY DX Notes for Weekending 27th June 1990.
Part 3 of 3.
BID: $RTDX0729

QSL Information.

VQ9RB is Dick Barnes, Box 55, NSF, FPO. SF, CA 96685-2000 U.S.A.

UA1OJ/UA9Q is at Box 27, Severodvinsk, 164500 USSR.

ZL0AIC will QSL via HB9AAA.

9L1US will QSL via WA8JOC.

5V7DP says to QSL via KA1DE.

J39BS will QSL to WB2LCH, not WB2CLH as stated last week. Sorry Erik.

RC8P/UB4MZG says to QSL to Box 22, Schastie, 348903 Ukraine USSR.

PZ1BS QSL to Box 813, Paramaribo, Surinam.

UA4FDS to Box 555, Penza 440061 USSR.

Notes Of Interest.

DA1WA will operate from Frankenstein's Castle from August 4th to 5th.

6W6JX will operate from C53 August 9th to 23rd with the call of C53/6W6JX. QSL via his normal path of F6FNU.

JH4IFF will sign VP2V/JH4IFF from around the 10th of August.

DF2UU is expected to operate from (TF) Iceland in August.

JA3DLE/1 worked FT1MM on July 22nd. Has anyone any information on this station? I can't find any information here.

The Malpelo operation scheduled for January 1991 has been moved forward to November 22nd this year. But they still need antennae and transceivers for RTTY. Can anyone help? If so, Telex 033413 Barabquila Colombia. Financial assistance is also needed and can be sent to: HK3BED, Box 584, Bogota, Colombia.

ZL0AIC is on Ross Island in the Antarctic, and works with/for the Greenpeace people.

I2KYM/IG9 is an IOTA station. Reference AF33, Zone 19.

GL DE DX1.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU, or via AMTOR on the VK2AGE APLINK mailbox.

SB ALL @ RTTYDX $KT7H0726
World Radiosport Aftermath

BID: $KT7H0726

It's been quite a week in Seattle! We just hosted the World Radiosport Team Championship, which is the first time ever that a radio contest was held with all of the participants in the same area.

Next week I will be sending out a summary of the scores and some "war stories" from the crew that hosted the contest and the teams. I attended a couple of the social events, but could not participate fully because of my involvement in War and Peace, an opera production of the Goodwill Games Arts Festival.

I was very impressed by the group that put on the contest, the volunteers who helped host the foreign guests, and the operators from around the world. The parties and the comraderie were great! I was most impressed with the Soviets. . .a real fun bunch of guys, some of them excellent English speakers, and do they know how to drink vodka!

More news next week.

73,
Tad

In article <3607@radio.oakhill.UUCP> charlie@oakhill.UUCP (Charlie Thompson) writes:
]used Pspice to simulate the response from filters
]designed using ECD. Normally you can expect
]about ~6dB of insertion loss; a gasfet preamp after
]the filter can make up for this. In summary the R7000
]can get overloaded from strong signals like FM stations.

A couple of comments here:

(1) the preamp AFTER the filter will have no beneficial effect at all on a well designed receiver such as an R7000. Any good receiver has more than enough gain - the enemy is noise, ie you want a good noise figure. A 6dB insertion loss filter will add 6dB to your noise figure, pre-amp or not! Once you have lost the SNR, you can never improve it again.

(2) It is quite possible to design filters with very low insertion loss (<.5 dB for example) to do what you want. However, the lower the insertion loss, the higher Q elements you need. At 100MHz that shouldn't be much of a problem. See the Reference Data for Radio Engineers for design data (although it takes a lot of fiddling with the way the data is presented in order to convert it from analysis to design data). I'm sure there are other references. The calculations are easy enough that you definitely don't need a computer to do them. Any decent library should have the book. Possibly the Amateur Radio Handbook has it also, but I haven't checked.

(3) The Radio Shack filter is likely to beat anything you can do yourself unless you work hard at it and have the equipment to really measure the filter performance (preferably a sweep generator or tracking

generator/spectrum analyzer). At a minimum, you need a signal
generator with flat output over the 75 - 130 MHz frequency range,
and some sort of good RF signal level detector (properly done,
a diode detector and a volt meter, and a calibration curve to get
dB's from it.

(4) If you build the filter, keep in mind that component characteristics
(using the right type of capacitor and inductor), component placement,
and grounding and shielding is going to significantly affect the
results. Use the right parts, LOTS of ground plane, high Q coils,
good capacitors, and appropriate shielding.

> Dave N4DJS

There may be several reasons:

1. No desire to work VHF.
2. lack of time to study (or memorize) due to other commitments.
3. travel difficulties to exam sites for upgrading (one could live in a remote area, or be too young or otherwise unable to drive).
4. A desire to try ham radio for a while before deciding to stay in it. Remember, entry-level licenses are there to give people a chance to try ham radio out without having to take so many exams.
5. Only purpose of license is to communicate with spouse on 220 MHz repeater.

There may be others. When I had my Novice (1972-74) I was too young to drive and had difficulty getting from Fayetteville NC to Norfolk VA. As a result I was unlicensed for almost a year after my Novice expired. This was not my choice but a consequence of NON-RENEWABLE licenses, which I oppose.

Fortunately most VEC exams are held more frequently and are more geographically distributed than the FCC exams were; but there are some parts of the country where it is difficult to find a place to take an exam.
There are others where it is very easy. Within a 100 mile radius of Charlotte there is an exam given about 3 out of 4 weekends. So that reason would not apply here.

]>Consider base-band filtering. It's sure a lot cheaper to filter
]>at low power at baseband than at RF at high power. Let's say we
]>make a PERFECT baseband filter. We STILL need an ULTRA LINEAR
]>modulator or the interference comes back. This is true of
]>either fast frequency hop or direct sequence.
]>

]
]In our 100,000 watt TV transmitter, the sideband filter is a little
]SAW filter you can hold in the palm of your hand. In our old 50,000
]watt transmitter the filter was a huge water cooled monster on the
]output of the transmitter. The SAW filter is installed just after
]the modulator at the 100 miliwatt level. Assuming reasonable
]linearity (<2%) in the following power amplifiers, this little guy
]can do the job nicely. Assuming your PA doesn't act as a wideband
]noise generator on it's own, you don't need huge cavities anymore.
]Transmitter and filter design have changed dramatically in the last
]ten years. Nobody does "high level" modulation anymore and achieving
]linear power is much easier than it used to be. Amateur technology
]has a long way to come from the old Micor to the modern world.

Point well taken. However, your 100,000 watt TV transmitter is not
protecting sensitive receives just outside the passband. How much
are your sidebands reduced? 60 dB? That's just not enough for
the case we are talking about. 2% linearity is nowhere near
good enough - I'll bet your linearity is much better than that.

Remember, when we talk 100dB range attenuation, we are getting
into tough stuff. Your SAW probably leaks more than that - what is
the passband vs. stopband attenuation of it? Add to that nonlinearities,
AND wideband noise, and you may still have a problem if you are operating
in the amateur 440 band (or 2 meter) and trying to protect other services
in the 450 band (or 150). Finally, one reason for pass cavities is
that transistor amplifiers do radiate significant broadband noise, even
if unmodulated. When we put a pass cavity on an FM repeater, we lower
the site noise significantly. Leaving out that protection means that
the broadband noise is a problem. Of course, I guess we could use
tubes...

W1GG Retransmission

DX Bulletin 30 ARLD030
From ARRL Headquarters
Newington CT July 27, 1990
To all Radio Amateurs

Thanks to Paul, KB1BE, and the Connecticut DX Association for the following DX information.

YEMEN, 7O. Pierre, F6HIZ, has announced that F2VX and F6EXV will operate from Aden from July 28 to August 12. They have been issued documentation from the Minister of Communication, Republic of Yemen. The calls used will probably be 7O1AB and 7O1AC.

Check 5 KHz up from the bottom of the bands for CW, with the exception of no CW operating on 80 meters. Check 3787, 7065, 14125, 14145, 14195, 21195, 21295, 28445 and 28495 KHz for SSB. They will announce the split listening frequencies.

THAILAND, HS. Members of the Japan UNICEF Ham Club will activate HS0ILY July 27 and 28. Operations will be on 80 through 6 meters, CW and SSB. QSL via JA2BCQ.

MARKET REEF, OJ0. Callsigns for the Market Reef dxpedition scheduled to start July 28 will be OJ0/KF7PO on SSB and OJ0/N7BG on CW. QSL via KF7PO.

CRETE, J4. A group of Greek operators will sign J49G from Gavdhos Island starting August 1. This two week operation will be on CW, SSB and teletype modes. The island is located just off the southern coast of Crete.

SVALBARD, JW. A Netherland dxpediton to Svalbard by JW/PA3CDO, JW/PA3FMK and JW/PE1MIS will be active from July 27 until August 8. Activity is planned for 80 through 6 meter CW and SSB. QSL to each operator's home address.

NORTH COOK ISLANDS. Look for Kiyoko to sign ZK1XH from North Cook. She has been using ZK1BY from Raratonga.

> 220 vs 440 ? It seems that you can't have everything. Any advice on that ?

Find a Drake UV-3 at a hamfest or in the Yellow Sheets. It has the
capability of 144, 220, 440 all in one not so small radio. It has
four diode programmable memory channels for each band, and its VFO is not
confined to the standard channel spacing for each band as some of
the newer radios are.

This is the kind of radio with which you could be comfortable for multiband
packet operation; you certainly wouldn't miss it mobile, it's too big!

Just a thought.

The best way to get started IMHO is to find an amateur or amateurs in your area who teach classes for new hams. One way to find out if there are any is to write to the American Radio Relay League, 225 Main St., Newington, CT 06111 and ask for their Prospective Ham Package. It will list clubs and local hams who are willing to help newcomers and who gives tests locally. Another source is your local Radio Shack. They might know some local hams, but even if they don't their Novice Course for $19.95 will give you all the information you need to pass the test. It even includes 2 morse code practice cassette tapes. I used their courses to pass both my Novice and Technician tests. I also passed the General written test using their course. All I need now is to practice my morse code. Good luck and hope to talk to you on the air soon!

<PLB%PSUARCH.BITNET@CORNELLC.cit.cornell.edu>
"P Bandini, PSU Arch Dept, 814/863-0062" writes:
>Frankly, I don't have hard facts. That would require survey, data analysis,
>etc, and all it would provide is confirmation of a basic truth that we
>already know about: there is no free lunch. Anything that is in limited
>supply does cost (land, water, spectrum...)

A logical statement can be made about supply and demand. Cell sites are built to "supply" a service. There is a certain amount of overhead cost that is required to do this. It is NOT a trivial amount. A business person in cellular or land mobile service does NOT design his system to meet emergency or overload conditions. If he or she did, it would reduce profit by the requirement of higher equipment installation and maintenance costs that would be used only rarely. Even if someone DID consider it, they realize that in such an emergency, there are going to be other choke-points such as the Telco switch itself. It is just not logical (profit-wise) to do so.

>Lately we've been hearing a lot about how saturated landline phones AND cell
>phones become in case of an emergency. A gut reaction is "if they had more
>channels, the saturation threshold would be higher, right?"

Let us say that this is true. You would pay DEARLY for the cost it would take to implement this. You would be paying for peak demand versus average demand and the normal customer would not tolerate the additional costs. Most especially so if even with the additional capacity of the cells, the call could not be completed due to overload of the Telco switch. I.E. You would be paying more for the privilege of hearing a busy signal from the Telco.

A much more logical method is to use the existing bandwidth more efficiently rather than just adding more channels (which means more equipment, which means more maintenance, which adds up to more $$$) This is why the "digital" radios are being pushed! In addition, when this happens... the customers will all have to go out and buy NEW radios... (maybe not all at once but eventually) this is called "planned obsolescence" and is a favorite revenue producing trick. Ask some of your Motorola dealers sometime what they do with old radios that are "traded in" on newer models. In many MANY cases, the dealers are told to SCRAP the old radios. Not give them to hams, or sell them on the side.. just SCRAP them. Reason? Motorola no longer has to stock spare parts support for the older models and thus can reduce their parts overhead.

>Also, more channels = more customers = lower cost per customer, right?
>(At least, that's what has happened for just about anything I can think of)

Up to a POINT that is true. There is a balance ratio between number of cells versus number of users. That exact balance equates to the maximum profit. Deviate from it either way and you will start losing money. It is logical for the cell system operator to overload his system rather than underload it by design. It is a safer practice and is more likely to generate a consistent income. Always remember.. the purpose of cellular telephone is to MAKE MONEY. Every decision that they make is based on that premise.

>So, since we are not really arguing about this basic truth, the question
>could be "Am I willing to pay for your 'service' through a higher cell phone
>bill?" I might, but then we'd have to enter a less ambiguous contract: how
>do I access your 'service'? where do I find you when I need you? can you
>guarantee the accuracy of your 'service'?

Exactly! Would you enter a contract where the cell operator says "I will provide you with a 95% guarantee that I will get you to a Telco switch and in order to do that it will cost you $xx.xx amount more... but after that there are no promises!"? Maybe YOU would, but the average person would not, at least that is the general thought of the cell operators. Plus, keep in mind... THEIR profit margin. If they think that adding this capability would enhance their PR and bring in more customers, then they might do it. Logic says that it would be a bad risk unless there are a LOT of emergencies to keep this thought uppermost in the customers mind.

(sorry, but "your cousin in SF is ok" just won't do... when I *hear* her
>voice I will *know* she's ok...)

I would suggest then that the best solution for you and your cousin is for you both to become Amateur Operators.

>I would like to extend my sympathies to all volunteers of all kind, whether
>it be driving an ambulance, or preparing hot food in a shelter. I hope these
>comments will not be interpreted as an attempt to minimize their (in)valuable
>contributions.

I have to admit that it appeared to me that your comments just might be trivializing the importance and amount of service provided by Amateur operators during major emergencies and that you feel that such services could be better served by releasing the spectrum to commercial interests.

With this thought in mind, I have to say that you are more than likely always going to get the best EMERGENCY service from Amateur Radio simply because they are not profit motivated and are willing to switch their spectrum from hobby use to total emergency service on a moments notice. Commercial service operators are just that.... commercially motivated. They will ALWAYS plan a system with the maximum profit in mind and not "once in a blue moon" emergency conditions. If they can do the second while not affecting the first, they will. Otherwise, I would not care to count on it.

>However, I'm wondering if in the case of emergency communications, ham
>radio is the *best* we can have... comments anyone?

Absolutely NOT! In the case of emergency communications, there are a LOT of better methods than "Amateur Radio".   Military Satcom comes to mind where a small radio and little fold out dish (about 1 foot by 1 foot) can be made operational in a matter of minutes, can talk across the continent or across the street, and can be made secure in a few seconds AND can be used by most any halfway trained operator. This is just one example but there are many MANY more! Ham radio in no way represents the *best* of theoretically possible communications methods. But it *IS* usually available first and can inherently handle a higher volume of trivial traffic than can the "designed for emergency" systems. You have to realize that whether or not your "cousin is ok" is a VERY TRIVIAL matter in the total scope of emergency communications. If there is enough depth available to handle such messages, that's great.. but in major emergencies Amateur Radio has time and time again been initially utilized as THE ONLY communication available at the disaster site. Once better methods are in place to handle the REALLY important traffic, ham radio can be released to handle secondary (trivial) traffic such as health and welfare.

Please understand, I realize that knowing whether people are dead or alive is a very important thing TO YOU. But if you don't know about this person, he or she will survive and so will you. Matters concerning medical supplies for the dying, potable water and drugs to prevent major outbreaks of infectious diseases and the local coordination of emergency recovery services take implicit priority over the status of relatives.

Ham radio provides the very necessary DEPTH, and sometimes is the ONLY communication for these matters. As such it is well worth keeping the spectrum for, would you not agree?

Ok, John, you did so well on your first assignment, now you get to work over a more difficult call sign. Yup,you guessed it, it's mine. A really nifty one to boot. If always thought that the local FCC head dud had it in for me 'cuase he caught be boot-leggin' on CB back in the 70's. I made the mistake of telling him that I really wanted to be a HAM and would give up my CB license, earn a HAM ticket, if only he would forgive that $200 fine....and the rest is history....

Oh, ya, my super-duper, hum-dinger call is -------> WB6WUI

Theoretically, the costs should be lower. However, I highly doubt it. One reason is greed. Why should the cellular companies lower their prices? They've got a great deal. And with more channels they rake in more profit. The 'public' doesn't need to know where the channels came from. Come to think of it, they (the cellular companies) might even advertise... "Use our company, Cell 2000. We have many more channels whyich you can use for only the base cost plus a slight nominal charge." Indeed, the cost *might* go *up*. Perceived value...

Just which frequencies should these new channels come from? Regardless where they come from, new antennas will need to be installed (assuming they come from the ham bands). The current antennas wouldn't be tuned to the new frequencies.

The people who have commented here seem to have forgotten the possibility of interfernce from SS to weak-signal ham activities. W1EJ tells me that he calculated the increase in noise floor from a 440 MHz SS rig he saw advertised.... the increase was 3 dB at a free-space distance of 50 miles from the one-watt rig when something like twice the bit rate away. The rig had little RF filtering, but the key point is that the EME activities would have been clobbered even with many 10s of dB better filtering, if the distance was a few miles. We're talking about 100-150 dB supression of the redundant outer sidebands. Low level filtering can make it cheaper, but the linearity requirements are severe and will still call for good filtering after the final amp.

Or so he says.

From article <1990Jul29.060743.9570@bellcore-2.bellcore.com>, by karn@thumper..bellcore.com (Phil R. Karn):

> I think the aforementioned article would be better titled "A Microcomputer-Controlled NiCad-Battery DIScharger." If you look closely at the schematic, especially the interface between figs 1 and 2, you will note that there is no direct path between the constant current source and the battery, and furthermore the MOSFET pass transistor is bridged across the battery terminals.

And I thought that I was the only person to notice that the two halves of the schematic did not make sense when connected.

Now, who noticed that the microcode (Assembly Code Listing) was NOT available from the ARRL! Between the incorrect schematic AND the lack of a program listing for the microprocessor there is little chance of successfully constructing the project without purchasing the kit from the author.

I understand the lack of space in the magazine to print the listing, but it should be available to those who request it. Otherwise I feel the article is nothing more than a subtle advertisement for a high priced charger.

Question:

Could the same effect (that of turning off the high current charge rate once a voltage peak is detected) be accomplished in an analog circuit?

Answer: YES!

> If you used an op-amp, fed both inputs through long time constant integrators from the NiCads. Make one of the time constants 3-4 times the length of the other. Then, the output would change state after the voltage "peak" of the charged NiCad occurs. Use an SCR (or a flip/flop) to switch the charge rate to a trickle rate. Yes, I know it isn't as sexy as a microprocessor controlled charger, but, it would probably work just fine. I'll probably breadboard one to give it a try.

I picked up a used 2 Meter rig with no manual. It is a SANTEC ST-20T. Mostly a clone of my ICOM 02AT and I can set frequency and repeter offset, but don't know how to program for subtones, or even set the clock. Wouldn't think that would be to hard, but I haven't figured it out yet.

If anyone has one of these and can copy the manual I sure would appreciate it. Send me e-mail, uunet!sequent!dale is a good path. I have been on vacation for three weeks with one more to go so I'm not reading the net or mail regularly.

Thanks to the responses for my request for the TS-430S manual. I got one, have some thank you mail to send out for the other responses on that request, time away from computer has interfered with that.

While I'll be the last to say that PL is a bad idea, I have to say that
it's not the panacea that many have held it out to be. You can't change
the laws of radio - especially such things as heterodynes and capture
effects - with a PL encoder.

Easy question. They apply to all hams who are Extras. One of the privileges of being an Extra is permission to operate from space. (Does the Shuttle count as a DXCC country?) Thus you are prepared for questions on these new privs in the study guide for Extra.

I would appreciate if someone could tell me the number of the diode
to cut and it's location on the PC board, so that I could restore full
800 MHZ coverage.
Also, is it possible to get 200MHZ-400MHZ with this scanner?
Thanks in advance.

During the AMSAT-UK satelite colloquium in Surrey, Great Britain, I saw
the ICOM R1 ready available. I forgot to write down the price, sorry.
Anyway, if someone comes over to the UK, you can get one there.
I believe it is also available in other European countries, but have
not checked. If you're going on a business trip..

The confusion lies in that you should be looking in books describing microstrip inductors rather than stripline inductors. I would not say that you are more likely to see a microstrip circuit in "real life" than a stripline. In general it is easier to fabricate a microstrip line than a stripline circuit but microstrip suffers from dispersion since some of the field lines travel in the slow dielectric and some in the faster air. So depending on your application one may offer advantages over the other.

You could try "Microstrip Lines & Slotlines" by K.C. Gupta et al.

You could also look-up back issues of "RF design" magazine. There was an article that gave all the relevent equations, which appeared about 2 years ago.

>repeat this cycle again and again. At the present time DOVE's RF output power

I listened to the AMSAT net this past Sunday (7/29). It seems that after
3 days on the air, DOVE has shut down again. Apparently, though, this time
it is due to 'pilot error'. N4HY got DOVE working just before leaving
for a conference in England, and passed babysitting responsibilities on
to someone else while he was gone. DOVE has a 3-day watchdog timer in it
that will shut down the 2m transmitter if a certain command is not received
from the ground on a regular basis. Since there was some confusion about
what command that was, apparently this timer has timed out. The bulletin
predicts resumption of transmissions after N4HY returns sometime this week.

The Realistic HTX-100 25 watt 10 meter SSB rig is pretty satisfactory in many ways.   It offers a cost effective way to get on 10 SSB mobile, and gives a small saving compared to the fuller functioned Uniden unit from which it is derived. In my car with a quarter wave whip I work Japan, Australia, and New Zealand regularly from CA while commuting.

However, I have noted one flaw that bugs me; the receiver bandwidth is too broad. With weak signals there is far more static white noise crashing in the background at high audio frequencies than is necessary. Its so bad, in fact, that I can often improve intelligiblilty (in marginal conditions) by switching to CW mode, where the bandwidth is probably less than 1 kHz. Sure, this cuts down on the audio BW to less than the 3 kHz or so which most would say is near optimal for SSB audio, but it also cuts down on the static noise background even more, for a net gain. This says to me that the SSB mode audio BW is larger than optimal (for weak signals).

I suppose the ideal fix would be to use a narrower IF bandpass, but that too complex a mod. How about instead a simple mod which puts a low-pass

```
audio filter in front of the final audio amplifier?  Has anyone done this?
I can imagine a small PC or perf board with an IC amp chip and a few R's
and C's fitting inside the case somewhere, which rolls the audio off
sharply above 3 kHz.  Maybe it should have an on-off switch, so in strong
signal conditions you could switch it off and have nicer audio.

IMHO, such a mod would make a very useful improvement to the HTX-100.
Probably, such a mod would be usable in the Uniden "parent" unit as well.

Anybody interested in engineering such a mod, and passing on the details?
Alternatively, if someone can design it but doesn't want to build it, I'll
do the layout, build it, and test it.

OK Folks,

Here's an interesting one for you antenna experts. I recently put a couple of HF antennas on my van. I used Radio Shack mirror mounts, springs, and Hustler's new MO-4 masts. I have five bands worth of resonators, all with excellent results EXCEPT 20 meters. If the whip is too short and resonates above 14.45 or so, I can get a good bandwidth and almost 1:1 SWR. Same thing below 14.00. In fact I can get a good 175 or so kHz almost 1:1 bandwidth from around 13.10 to 15.00 by adjusting the whip EXCEPT for 14.00-14.45, where I cannot get it below about 2.5:1! I have used both mounts, changed coax, springs on and off, moved/removed other antennas on the vehicle, done everything except exchange the resonator. All other bands work great. I can put my tuner in line and bring it down, but I would like to get by without the tuner. The radio I am using is an ICOM IC-720A.

If anyone has any suggestions, I would be most appreciative. Please e-mail or post, preferably both. I have tried just operating with the high SWR, but no one seems to hear me. There is no noticable drop in output power per the meter like I get with a really bad SWR, but in checking with other stations, there is a significant difference with the tuner in than out.

Thanks for any help any one may provide.

73,
Michael WA7SKG

Subject: Re: Has anyone made any homemade valves...

When I was in undergrad school, EE, the department acquired a prof. who specialized in transistor construction. So the theory was each student would take a lab from him to build a transistor that would be used for all the remaining labs. Working transistors were generally not available at that time. We made junction transistors I believe. Details are quite difficult to remember. Anyway, they had to bake for several days at some outrageous tempreature. Seems that the janitor found the oven on and unplugged it - there was a rule that nothing could be left on at night. No amount of persuasion from the Dean ever solved that problem. As a result, most of the units were DOA. Mine must have been close to the center of the oven. It produced an amplified sine wave for close to a minute before going up in smoke. Our attempts at determining power dissipation were not very good. At least one of the units still worked at the end of the semester.

I hate to say it, but I think that the 'professionals' will keep their 'professionalism' where the money is. I think its too bad that we've proceeded to the point where ham technology is a few years behind commercial technology as opposed to commercial being behind hams. Realistically, I don't think hams are going to do the custom chip fabrication and so on needed to build these "cellular" systems. I know we could just use their technology directly, but then, just go buy a cell phone.

Hams do, however, have one thing over commercial technology. We are not market driven. This leavs a lot of room to try out unique, or even bizarre ideas which could be very useful in the future. There is no way commercial interests would put a lot of money into some of the projects that I've seen people come up with, but a lot of them are very good ideas.(I like the baloon launches myself). These creative ideas do not necessarily need people trained in professional engineering, and in most cases, this professional training impeeds things(you have to unlearn what they teach you to be creative).

Anyway, that's my liberal thought for the day.

My point was perhaps misunderstood. If the receiver is suffering from intermod/overload it is better to first filter (even at a loss) and then to amplify. If you don't do this then the large signals will MIX IN THE PREAMP and you'll have intermod city. Noise figure is a secondary concern if your receiver is wigged out by a 50KW FM broadcast transmitter. I live 4 blocks from a behemoth FM station. FET amps are only linear for small signal levels so if you drive a 200 mV signal into a FET preamp you are likely to get mix products with other signals as well as harmonics.

Low-loss passive filters would be the best way deal with the filter-before pre-amp problem.

> NICAD CELL CHARACTERISTICS

I read this and none of it disagreed with what I've learned from my friend and the Sanyo and GE books. Of course when you have cells in a battery pack, it is unfortunately difficult to do anything with or to the individual cells.

"Wouldn't it be nice if" all battery packs had a standard connector that had two pins for each cell? To use the pack you'd attach a "series" connector. To charge the cells you'd use a "parallel" connector (with sufficient smarts in the charger to do the job right of charging and checking each cell).

Great. So I pass my exam, then write NASA that I want to operate from the shuttle? These rules don't apply to all extras, only the those with the means to launch a sattelite or get a ride on the shuttle. That is very few even compared with modes that most would consider pretty esoteric, like moonbounce.

I have also heard of astronauts without extra tickets being granted temporary priveledges for the duration of a flight. If that is routine procedure, then being an extra seems to have little to do with it.

Here is a more down-to-earth example. To get a ticket you have to pass various exam elements with designations like 3e, 4a, etc. In a sense, this affects every new ham. Once you get your license, those designators have zero effect on whether you will operate your station legally.

Supposedly the reason for the legal portion of the exam is to ensure that you know the rules well enough to operate within the law. What is the point of asking which designators are required for which class license when there are practical questions that won't get in for lack of room?

Come on, the R7000 will do a dandy job with cellular. Why would
Icom refuse to bring in the R1 on that basis. I keep hearing that
there is a patent infringement issue involving Uniden that is the
"real" reason that they are not being imported.

>(At least, that's what has happened for just about anything I can think of)

...except telephone service. The marginal cost for adding an additional

customer to an existing cell system is zero (and it's nearly zero for POTS).
True, you ocassionally have to add another cell cite or MTSO, but that depends
on the _stochastic_ nature of the users, and not necessarily on the absolute
numbers. For example, you need a lot more cells during drive times than at
midnight...

What has gotten cheaper are the cellphones themselves, due to economy of scale
(and the use of old technolgy - NFM). Digital cellphones initially will be
more expensive, but economy of scale will drive them down as well; given the
larger market, the potential exists for even greater mass production savings.

>   a try.

In Wireless World (Nov 1983) was a design for a Fast NiCd charger
that alternately charged and discharged batteries and detected the
difference between the peak charge and discharge voltages.
It claimed to charge batteries in an hour or so.

"The charger to be described in this article relies on a
voltage-sensing method, but a rather different one. If a
moderately heavy charging current is applied to a NiCd cell
for a short period, the terminal voltage will quickly rise
to a level somewhat higher than the voltage marked on the

> cell. Discharging the cell a little will reduce the terminal voltage once more. A repeating cycle will produce a succession of slowly rising 'peak' and 'trough' voltages, as shown in Fig. 1 [Not shown here, sorry.].
>
> "If the cycle is repeated for long enough (Fig. 2 [not shown]), there will come a stage at which the peak voltage is increasing much more steeply than the trough voltage. At this point the cell is losing the ability to accept further charge and the charger can be shut off. By measuring the trough voltage as a fraction of the peak voltage it is possible to make an end-point detector which works independently of the number of cells under charge, since the proportions will be constant whether there is just one cell or a dozen."

I haven't made one of these yet. Most of the parts substitutions are easily determined (but does anyone know a replacement for a BYX71-600?).

Mostly I need to get "a round TUIT".

I have an Apple II Plus that isn't doing much except gathering dust.
I figure it could have a meaningful existance if it could contribute to
HAM radio.
Is anyone aware of:

- Software for RTTY, CW, Packet, ...? Freeware, shareware, retailware?
- BBS for Apple II's with emphasis on HAM radio?
- Ways of using the cassette input and output port as a tone modulator or demodulator?
- Logging programs, direction finders, radio controllers, etc.?

Send replies via INFO-HAM or directly to my BITNET address: TJB@NISTCS2

Thanks in advance, Tom Buckley.

There has yet to be an American 'ham in space' with an Extra ticket. ALL of them have obtained waivers. Agreed, the rule is pretty silly.

Being one of the very few people who have actually helped prepare an application for space operation (as part of the early Pacsat work) I can say that I looked up the requirements in the rules. As I recall, there weren't any questions about space operation on my Extra test in 1973, and even if there were I wouldn't have relied on my memory.

Amateur exams have a problem shared with many other exams - they test one's ability to do rote recall rather than test one's ability to reason out solutions to problems. And nowhere is there more undiluted emphasis on rote recall than in the CODE test...

Yes, anything at all to do with semiconductors is expensive, because

you need ultra clean rooms, fine geometries, and dangerous chemicals.
(And I mean _real_ semiconductors, not cats whiskers :-)
But ... there`s a way.

MOSIS (1-213-822-1511) is the best bet for the small experimenter. $500 gets
you 4 packaged parts in cmos 2 micron technology,
132 pin pga max. They have a modem number; you give them yoiur design data
base in electronic form, and at their next scheduled run (they have
runs every 1-2 weeks.), they run your design through with many others,
and mail you the parts. Good for prototyping an idea
